RE: 4800 Voges Road Tree Survey (Heartland Project #20200315)

Summary of Work

Heartland Ecological Group ("Heartland") performed a survey of trees present within a woodland on the 4800 Voges Road property on March 11-14, 2021. The 4800 Voges Road property contains an approximately 11.59-acre woodland and is located northeast of the intersection of U.S. Highway 51 and Voges Road, in Section 27, Township 7 North, Range 10 East, City of Madison, Dane County, Wisconsin (see Attachment 1: Project Location Map). The survey was requested for inclusion in plans for development of the parcel.

The tree survey was conducted by Scott Fuchs of Heartland. Each live tree encountered with a diameter at breast height ("DBH") of at least 6 inches was identified to the species level, its DBH measured, and its location recorded with a handheld Trimble GPS unit capable of sub-meter accuracy (see Attachment 2: Tree Survey Map). Nearly all green ash trees (*Fraxinus pennsylvanica*) observed throughout the woodland are afflicted with emerald ash borer and are either dying or already dead. Although not living, green ash individuals were recorded to demonstrate the extent of emerald ash borer damage throughout the woodland. A total of 1,132 trees with an average DBH of 12 inches were recorded (see Attachments 3 and 4: Tree Summary Table, List of Surveyed Trees). The locations of the recorded trees were then superimposed on aerial imagery of the 4800 Voges Road property and presented in a map figure.

Site History and Observations

Historic aerial imagery of the property was reviewed to assist in understanding its history. At the time of the 1937 aerial photograph, only about 50% of the present-day woodland was occupied by tree canopy, with its remaining portions likely grassland and/or savanna type habitat, potentially utilized as pasture for cattle (see Attachment 5: Historic Aerial Imagery). The review area appears to contain a relatively open oak woodland at this time. The trees visible are likely a combination of bur oak (*Quercus macrocarpa*) and shagbark hickory (*Carya ovata*), some of which remain to this day and were observed during the tree survey (old trees of ~150 years of age, ranging from 20-40 inch DBH). Since 1937, the woodland has filled in significantly with ash, cherry (*Prunus serotina*), box elder (*Acer negundo*), and elm (*Ulmus americana*) in the absence of fire and/or pasturing.

Ruedebusch Development & Construction
4800 Voges Road Tree Survey
March 15, 2021

The woodland is currently dominated by cherry, shagbark hickory, bur oak, and box elder. Ash trees were previously co-dominant, but nearly all ash trees observed were dead or dying due to emerald ash borer. Additionally, about half of the bur oak trees observed appeared diseased, with large sections of missing bark and dead limbs present (see Attachment 6: Photolog). Hackberry (*Celtis occidentalis*), white oak (*Quercus alba*), red oak (*Quercus rubra*), quaking aspen (*Populus tremuloides*), and American elm (*Ulmus americana*) make up the majority of the sub-canopy of the woodland. The shrub layer is co-dominated by invasive buckthorn (*Rhamnus cathartica*), cherry, ash, and box elder. Overall, the woodland remains relatively open. Buckthorn shrub cover is homogenous throughout the woodland but has not become solely dominant. The tree survey was completed in March when little herbaceous vegetation is observable; however, populations of invasive garlic mustard (*Alliaria petiolata*) were observed throughout about half of the groundlayer of the woodland.

Please contact me if you have any questions regarding this tree survey.
