Map of Radon Zones

What do the colors mean?

Color	Zone	Potential
Red	Zone 1 (red zones)	Highest potential; average indoor radon levels may be greater than 4 pCi/L (picocuries per liter)(150 becquerels per cubic meter (Bq/m ³))
Orange	Zone 2 (orange zones)	Moderate potential; average indoor radon levels may be between 2 and 4 pCi/L (75 -150 Bq/m ³)
Yellow	Zone 3 (yellow zones)	Low potential; average indoor radon levels may be less than 2 pCi/L (75 Bq/m ³)

NAAQS Table

6 Criteria Pollutants:
CO, Pb, NO₂, O₃, PM, SO₂

Pollutant [links to historical tables of NAAQS reviews]		Primary/ Secondary	Averaging Time	Level	Form
Carbon Monoxide (CO)		primary	8 hours	9 ppm	Not to be exceeded more than once per year
			1 hour	35 ppm	
Lead (Pb)		primary and secondary	Rolling 3 month average	0.15 µg/m ³ ⁽¹⁾	maximum arithmetic mean of 3 consecutive monthly means in a 3-year period
Nitrogen Dioxide (NO₂)		primary	1 hour	100 ppb	Annual 98th percentile of 1-hour daily maximum concentrations, averaged over 3 years
		primary and secondary	1 year	53 ppb ⁽²⁾	Annual Mean
Ozone (O₃)		primary and secondary	8 hours	0.070 ppm ⁽³⁾	Annual fourth-highest daily maximum 8-hour concentration, averaged over 3 years
Particle Pollution (PM)	PM _{2.5}	primary	1 year	9.0 µg/m ³	annual mean, averaged over 3 years
		secondary	1 year	15.0 µg/m ³	annual mean, averaged over 3 years
		primary and secondary	24 hours	35 µg/m ³	98th percentile, averaged over 3 years
	PM ₁₀	primary and secondary	24 hours	150 µg/m ³	Not to be exceeded more than once per year on average over 3 years
Sulfur Dioxide (SO₂)		primary	1 hour	75 ppb ⁽⁴⁾	Annual 99th percentile of 1-hour daily maximum concentrations, averaged over 3 years
		secondary	1 year	10 ppb	annual mean, averaged over 3 years

Regulatory air monitoring sites typically look like this: trailers hold air pollution monitoring equipment. This photo is from Houston, Texas.

Fine Particulate Matter in Madison, WI

Air Quality Index Categories

	Below WHO Air quality level is below standard of World Health Organization of 5 $\mu\text{g}/\text{m}^3$.	Index Value
	Good Air quality is satisfactory, and air pollution poses little or no risk.	0-50 ($\leq 12.0 \mu\text{g}/\text{m}^3$)
	Moderate Air quality is acceptable. However, there may be a risk for some people, particularly those who are unusually sensitive to air pollution.	51-100 (12.1-35.4 $\mu\text{g}/\text{m}^3$)
	Unhealthy for Sensitive Groups Members of sensitive groups may experience health effects. The general public is less likely to be affected.	101-150 (35.5-55.4 $\mu\text{g}/\text{m}^3$)
	Unhealthy Some members of the general public may experience health effects; members of sensitive groups may experience more serious health effects.	151-200 (55.5-150.4 $\mu\text{g}/\text{m}^3$)
	Very Unhealthy Health alert: The risk of health effects is increased for everyone.	201-300 (150.5-250.4 $\mu\text{g}/\text{m}^3$)
	Hazardous Health warning of emergency conditions: everyone is more likely to be affected.	301+ ($\geq 250.5 \mu\text{g}/\text{m}^3$)

Understanding PM_{2.5} Composition Helps Reduce Fine Particle Pollution

The different components that make up particle pollution come from specific sources and are often formed in the atmosphere. The major components, or species, are elemental carbon (EC), organic carbon (OC), sulfate and nitrate compounds, and crustal materials such as soil and ash.

As previously shown, PM_{2.5} concentrations are declining. Assessing particle pollution concentrations along with composition data aids in understanding the effectiveness of pollution controls and in quantifying the impacts to public health, regional visibility, ecology and climate.

Madison installing air quality sensors to bring 'hyper-local' pollution data to neighborhoods

City will share public-facing data as part of federally-funded project

BY SARAH LEHR • JULY 26, 2024 • UPDATED JULY 31, 2024 at 12:36 PM

Madison officials installed this solar-powered air quality sensor on the city's west side, near an already existing sensor overseen by the DNR. The aim is to compare the new sensor to the DNR's data to check for accuracy. (Photo courtesy of the City of Madison)

Something in the Air Reports

A series of reports highlighting the promising potential of satellite data to complement and enhance the United States' existing air quality monitoring network.

As a nation, we make great strides cleaning up air pollution—but not all communities benefit equally.

Satellite Data: Filling in the Gaps

*County Design Values
(from monitors)*

*County Design Value Equivalents
(Satellite-derived data)*

Holloway et al., in review *GeoHealth*

- Madison's air quality had been getting better... but wildfires change the story
- AQ is affected by shifting federal priorities for energy, EVs, environmental data, etc.
- Madison is the most densely monitored city (in the world?) ... but the narrative is complex given sources of PM, day-to-day variability, and impact of sources outside of our control
- New opportunities from satellite data could benefit Madison
- UW-Madison is a national and international leader on AQ research – how can this strength best align with city priorities?

Tracey Holloway - taholloway@wisc.edu
