**SUBJECT:** **Washington Plaza Development Traffic Impact Analysis**  
**City of Madison, WI**

---

## INTRODUCTION

Washington Plaza Capital LLC is proposing a mixed-use development to be located on the northwest corner of the East Washington Avenue intersection with North First Street in the City of Madison, Dane County, Wisconsin (Exhibit 1). Access to the site is proposed via three driveways; one full access driveway along North First Street and two right-in/right-out driveways, one along North First Street and one along East Washington Avenue (Exhibit 2). This traffic impact analysis (TIA) report was prepared to address the weekday morning and weekday evening peak hour traffic impacts of the proposed development traffic on the adjacent transportation system.

## STUDY AREA

### Study Intersections

The study area for this TIA includes the following existing and proposed intersections:

- North First Street & East Johnson Street (traffic signal control)
- North First Street & East Dayton Street (one-way stop control)
- North First Street & East Mifflin Street/proposed full access driveway (two-way stop control)
- North First Street & existing and proposed right-in/right-out driveway (one-way stop control)
- North First Street & East Washington Avenue (traffic signal control)
- East Washington Avenue & proposed right-in/right-out driveway (one-way stop control)

Each intersection is shown on the study area map on Exhibit 1. A transportation detail illustrating existing intersection lane configurations, speed limits, and approximate intersection spacing is shown in Exhibit 3.

## **Study Area Roadways**

*East Johnson Street (also known as STH 113 to the north of First Street)* is a southwest/northeast, six-lane arterial highway to the north of the North First Street intersection that transitions to a four-lane cross section through the intersection and to the south. The posted speed limit on East Johnson Street is 30 miles per hour (mph). There are sidewalks located along the north side of the roadway and the Yahara River bike path is located along the south side of the roadway within the study area. The Wisconsin Department of Transportation (WisDOT) 2018 annual average daily traffic (AADT) volume along East Johnson Street was 26,900 vehicles per day (vpd) to the northeast of North First Street.

*East Washington Avenue (also known as USH 151)* is a southwest/northeast, six-lane arterial highway with a posted speed limit of 35-mph. There are sidewalks located along both sides of the roadway within the study area. The WisDOT 2018 AADT volumes along East Washington Avenue were 38,800-vpd to the northeast of North First Street and 50,400-vpd (2019 count) to the southwest.

*North First Street (also known as STH 113 between East Johnson Street and East Washington Avenue)* is a four-lane partially divided arterial with a posted speed limit of 25-mph. Sidewalks are located along both sides of the roadway within the study area and dedicated bike lanes are also provided within the roadway. The WisDOT 2018 AADT volumes along North First Street were 15,600-vpd to the southeast of East Johnson Street.

## **DATA COLLECTION**

### **Existing Traffic Counts**

Turning movement traffic counts were collected at the study area intersections in mid-March of 2021 during the weekday morning (6:00-9:00 a.m.) and weekday afternoon (3:00-6:00 p.m.) peak periods. In addition, during these same time periods, turning movement counts were collected at the driveways to the existing site. Since the existing land uses are being displaced as part of the project, these counts were used to reduce these existing driveway trips from the overall transportation network.

Based on the turning movement traffic counts at the main study area intersections, the peak traffic hours at the study intersections were determined to occur from 7:15-8:15 a.m. (AM peak hour) and from 4:30-5:30 p.m. (PM peak hour). The traffic volume counts were compiled for these peak hours, balanced between the study area intersections, and are shown on Exhibit 4A as the Existing traffic volumes. The full traffic count data collected for this study is included in Appendix A.

### **Factored Traffic Volumes**

Since the turning movement counts for this study were conducted during the spring of the current health crisis/pandemic, historic hourly data from WisDOT's 2018 AADT count stations located along the East Johnson Street and East Washington Avenue corridors were compared to the weekday morning and weekday evening hourly through volumes collected at the study area intersections as part of this study as follows:

- The East Johnson Street volumes from the 2021 turning movement counts, northeast of North First Street, were approximately 82-percent lower during the weekday morning peak hour and 53-percent lower during the weekday evening peak hour than the 2018 WisDOT traffic volumes along the corridor during the typical pre-Covid weekday peak hour traffic conditions.
- The East Washington Avenue volumes from the 2021 turning movement counts, northeast of North First Street, were approximately 102-percent lower during the weekday morning peak hour and 63-percent lower during the weekday evening peak hour than the 2018 WisDOT traffic volumes along the corridor during the typical pre-Covid weekday peak hour traffic conditions.

Based on the comparison of historic WisDOT hourly weekday morning and weekday evening data, since the peak hour traffic volumes collected as part of this study were determined to be lower than the typical pre-Covid weekday peak hour traffic conditions, the year 2021 updated traffic volumes were “factored up” to typical (pre-Covid 2021) conditions based on this comparison. The existing factored traffic volumes were balanced through the adjacent study intersections and are shown as the Background (Factored) traffic volumes on Exhibit 4B. The historic WisDOT AADT hourly traffic count data and pre-Covid factor calculations are included in Appendix A.

## **PROPOSED DEVELOPMENT**

### **Site Description**

The conceptual footprint of the first floor for the proposed mixed-use development is shown on Exhibit 2. The proposed 6 story building is expected to include the following:

- Apartments/Townhouses – 306 units
- Commercial/Retail Space (first floor) – 16,500 square feet

Surface and underground (basement and first floor) parking are also included within the site. Access to the site is proposed via three driveways; one full access driveway along North First Street and two right-in/right-out driveways, one along North First Street and one along East Washington Avenue. The mixed-use development is planned to be constructed and operational in the year 2022 and is therefore included in the Full Build (with development) traffic volumes.

### **Trip Generation**

To address any potential future traffic impacts at the study area intersections, it is necessary to identify the hourly volume of traffic generated by anticipated development. Traffic volumes expected to be generated are based on the size and type of the proposed uses and on trip rates and fitted curve equations as published in the Institute of Transportation Engineers’ (ITE) *Trip Generation Manual, 10<sup>th</sup> Edition*.

The proposed development is expected to include linked trips. Linked trips occur when a motorist visits one or more tenant or land use within a development site (e.g., a motorist from the residential component visits a retail shop prior to leaving the overall site). Approximately 10-percent of the new commercial trips are expected to be linked trips.

The trip generation table developed for the proposed mixed-use development is shown on Exhibit 6. As shown, after linked trip reductions, the proposed development is expected to generate about 2,230 total trips over a typical weekday, with 115 new trips (35 in/80 out) expected during the weekday AM peak hour and 185 trips (105 in/80 out) expected during the weekday PM peak hour.

Madison Metro Transit runs several routes through the limits of the study area including routes 6, 15 and 23 along East Washington Avenue; routes 5 and 10 along East Johnson Street and route 27 which traverses both roadways via First Street. Most routes operate with approximately 30-minute headways. In addition, the City of Madison is working to implement a Bus Rapid Transit (BRT) system with a BRT station planned along East Washington Avenue near First Street.

Transit, pedestrians, and bicyclists may use their respective modes to access the identified development. However, to allow for a conservative (highest vehicular volume) analysis, these modes were assumed to make up a relatively small portion of the overall trips to/from the study area. For the purpose of this TIA, all trips to/from the proposed development site were assumed to occur via motor vehicle.

### **Trip Distribution**

The trip distribution for the proposed development, listed below and shown in table format in Exhibit 6, was determined based on the existing traffic counts, the type of proposed land uses and the location of existing populations within the immediate study area.

- 20% to/from the north on East Johnson Street
- 20% to/from the south on East Johnson Street
- 25% to/from the north on East Washington Avenue
- 30% to/from the south on East Washington Avenue
- 5% to/from the east on North First Street

### **Traffic Assignment**

The proposed mixed-use development new trips were assigned to the study intersections based on the above trip distributions. The traffic assignment is shown on Exhibit 7A.

Since the existing site was operational during the data collection, the existing driveway trips at the site were tabulated and distributed through the study area intersections within the transportation network based on the existing traffic patterns. The existing driveway trip traffic assignment, used as a reduction in overall trips to the system, is shown on Exhibit 5. The net new trips, which include adding the development new trips (Exhibit 7A) to the existing site driveway trips (Exhibit 5) are shown as the net new trips in Exhibit 7B.

The net new trips (Exhibit 7B) were added to the Background (factored) traffic volumes (Exhibit 4B) to generate the “Full Build” traffic volumes for the analysis. The Full Build traffic volumes are shown on Exhibit 8.

### **PEAK HOUR TRAFFIC OPERATIONS & QUEUES**

The study intersections were analyzed using the Synchro 11 traffic analysis model (outputs based on the Highway Capacity Manual, 6<sup>th</sup> Edition) and the peak hour turning movement

volumes estimated for the study area intersections. Intersection operation is defined by “level of service”. Level of Service (LOS) is a quantitative measure that refers to the overall quality of flow at an intersection ranging from very good, represented by LOS ‘A’, to very poor, represented by LOS ‘F’. For the purposes of this study, LOS D or better was used to define acceptable peak hour operating conditions.

The capacity analysis tables show the peak hour LOS, delays (in seconds per vehicle), and queues (in feet) for both the Background traffic condition and for the Full Build traffic condition. The Synchro capacity analysis worksheets for all analysis scenarios are located in Appendix B.

## Background Traffic Operations

Table 1 shows the results of the weekday morning and weekday evening peak hour operational analysis at the study area intersections. The study intersections were evaluated using the existing geometrics and traffic control as shown on Exhibit 3 and the Background (factored) traffic volumes shown in Exhibit 4B.

Table 1  
Background Traffic Peak Hour Operating Conditions  
With Existing Geometrics and Traffic Control

Intersection	Peak Hour	Metric	Level of Service (LOS) per Movement by Approach												LOS & Delay		
			Eastbound			Westbound			Northbound			Southbound

Queue		280'		265'		75'		195'		200'		65'		175'			

(-) indicates a movement that is prohibited or does not exist; (\*) indicates a freeflow movement.  
Delay is reported in seconds. Queue is the maximum of the 50th & 95th percentile queue, measured in feet.  
Where zero is shown for the volume at a particular movement, a minimum value of 1 was used in the model.

As shown in Table 1, all turning movements at the existing study area intersections are currently operating acceptably at LOS D or better during the peak hours under the Background (factored) traffic volumes developed for this study except the northbound left-

turn movements (LOS E) during the AM peak hour and the eastbound and westbound left-turn movements (LOS E) during the PM peak hour at the East Washington Avenue intersection with First Street.

## Full Build Traffic Operations

The proposed site access driveways were evaluated with stop control on the development site approach. Table 2 shows the results of the weekday morning and weekday evening peak hour operational analysis at the study area intersections with the proposed development operational. The study intersections were evaluated using the Full Build traffic volumes shown in Exhibit 8.

**Table 2**

		PM	LOS	-			C			-			-			-			*			*			
			Delay	-			19			-			-			-			*			*			

(-) indicates a movement that is prohibited or does not exist; (\*) indicates a freeflow movement.  
Delay is reported in seconds. Queue is the maximum of the 50th & 95th percentile queue, measured in feet.  
Where zero is shown for the volume at a particular movement, a minimum value of 1 was used in the model.

As shown in Table 2, with the additional traffic from the proposed development, all turning movements at the study intersections are expected to continue to operate acceptably at LOS D or better during the peak hours under the Full Build traffic volumes except the northbound left-turn movements (LOS F) during the AM peak hour and the eastbound and westbound left-turn movements (LOS E) during the PM peak hour at the East Washington Avenue intersection with First Street. In addition, the right-turn movements out of the East Washington Avenue intersection with the south development driveway are expected to operate at LOS E (only 4 seconds above the LOS D threshold) during the AM peak period under the Full Build traffic volume conditions, but with gaps created by the existing traffic signal located immediately to the north at First Street, this intersection is expected to operate better than reflected in the modeling software.

### **RECOMMENDATION MODIFICATIONS**

Modifications are expected to be necessary at the study area intersections to allow for acceptable and safe operations under the Background and Full Build traffic volume conditions. The following modifications, as shown in Exhibit 9, are recommended to accommodate the Background and Full Build traffic volume conditions. *Modifications are for jurisdictional consideration and are not legally binding. The City of Madison reserves the right to determine alternative solutions.*

#### Node 100: East Johnson Street & First Street

- *Background Traffic:* No modifications
- *Full Build Traffic:* No modifications

#### Node 200: First Street & Dayton Street

- *Background Traffic:* No modifications
- *Full Build Traffic:* No modifications

#### Node 300: First Street & Mifflin Street/Proposed West Driveway

- *Background Traffic:* No modifications
- *Full Build Traffic:*
  - Provide a full access driveway onto First Street as shown on the conceptual site plan.
  - Provide stop sign control on the driveway approach.

#### Node 400: First Street & Proposed East Driveway

- *Background Traffic:* No modifications
- *Full Build Traffic:*
  - Provide a right-in/right-out access driveway onto First Street as shown on the conceptual site plan.
  - Provide stop sign control on the driveway approach.

Node 500: First Street & Dillon Street

- *Year 2022 Background Traffic:*
  - Adjust green times for the northbound left-turn movement off of East Washington Avenue (expected adjustment of 2 seconds) during the weekday AM peak period.
  - Adjust green times for the eastbound/westbound left-turn movement off of First Street (expected adjustment of 2 seconds) during the weekday PM peak period.
- *Year 2032 Build Traffic:* No additional modifications

Node 600: East Washington Avenue & Proposed South Driveway

- *Background Traffic:* No modifications
- *Full Build Traffic:*
  - Provide a right-in/right-out access driveway onto East Washington Avenue as shown on the conceptual site plan.
  - Provide stop sign control on the driveway approach.

Table 3 shows the results of the weekday morning and weekday evening peak hour operational analysis at the study area intersections with the proposed development operational and with the aforementioned modifications constructed including signal timing modifications implemented.

**Table 3**

		LOS	-	E		-		-			-			-										
		Delay	-	39		-		-			-			-										
	PM	v/c	-	0.13		-		-			-			-										
		Queue	-	25'		-		-			-			-										
		LOS	-	C		-		-			-			-										

(-) indicates a movement that is prohibited or does not exist; (\*) indicates a freeflow movement.

Delay is reported in seconds. Queue is the maximum of the 50th & 95th percentile queue, measured in feet.

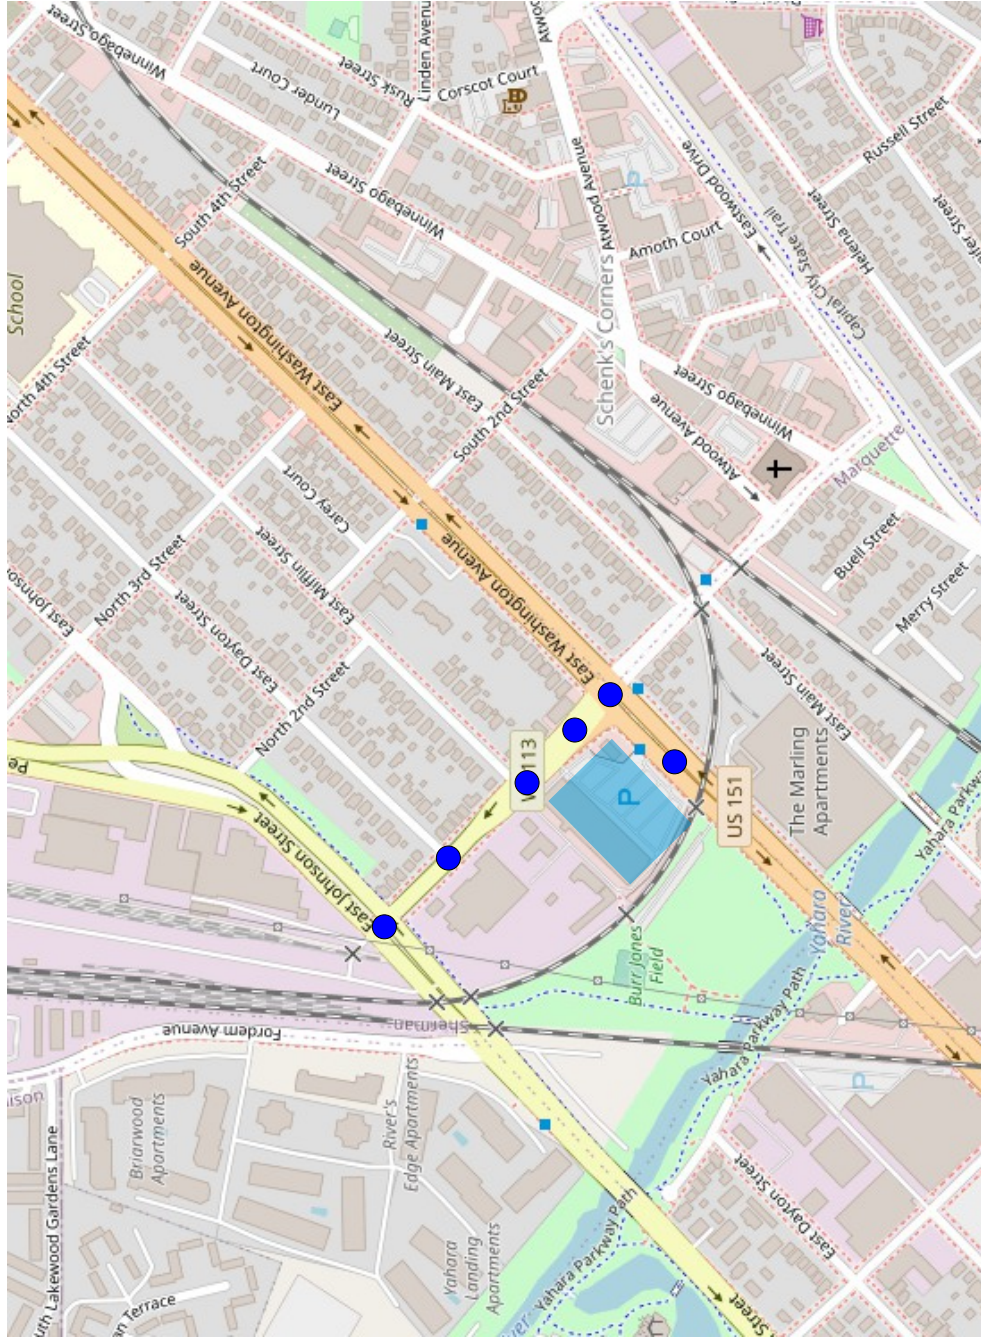

Where zero is shown for the volume at a particular movement, a minimum value of 1 was used in the model.

As shown in Table 3, with the recommended modifications provided to accommodate the additional traffic from the proposed development, all turning movements at the study intersections are expected to improve to operate acceptably at LOS D or better during the peak hours under the Full Build traffic volumes except the right-turn movements out of the development at the East Washington Avenue intersection with the south driveway which are expected to operate at LOS E during the AM peak period under the Full Build traffic volume conditions. It is expected that with a peak hour right turn volume of only 15 vehicles and delays of only 4 seconds above the LOS D threshold, and with gaps created by

the existing traffic signal located immediately to the north at First Street, this intersection is expected to operate better than reflected in the modeling software.

## **CONCLUSION**

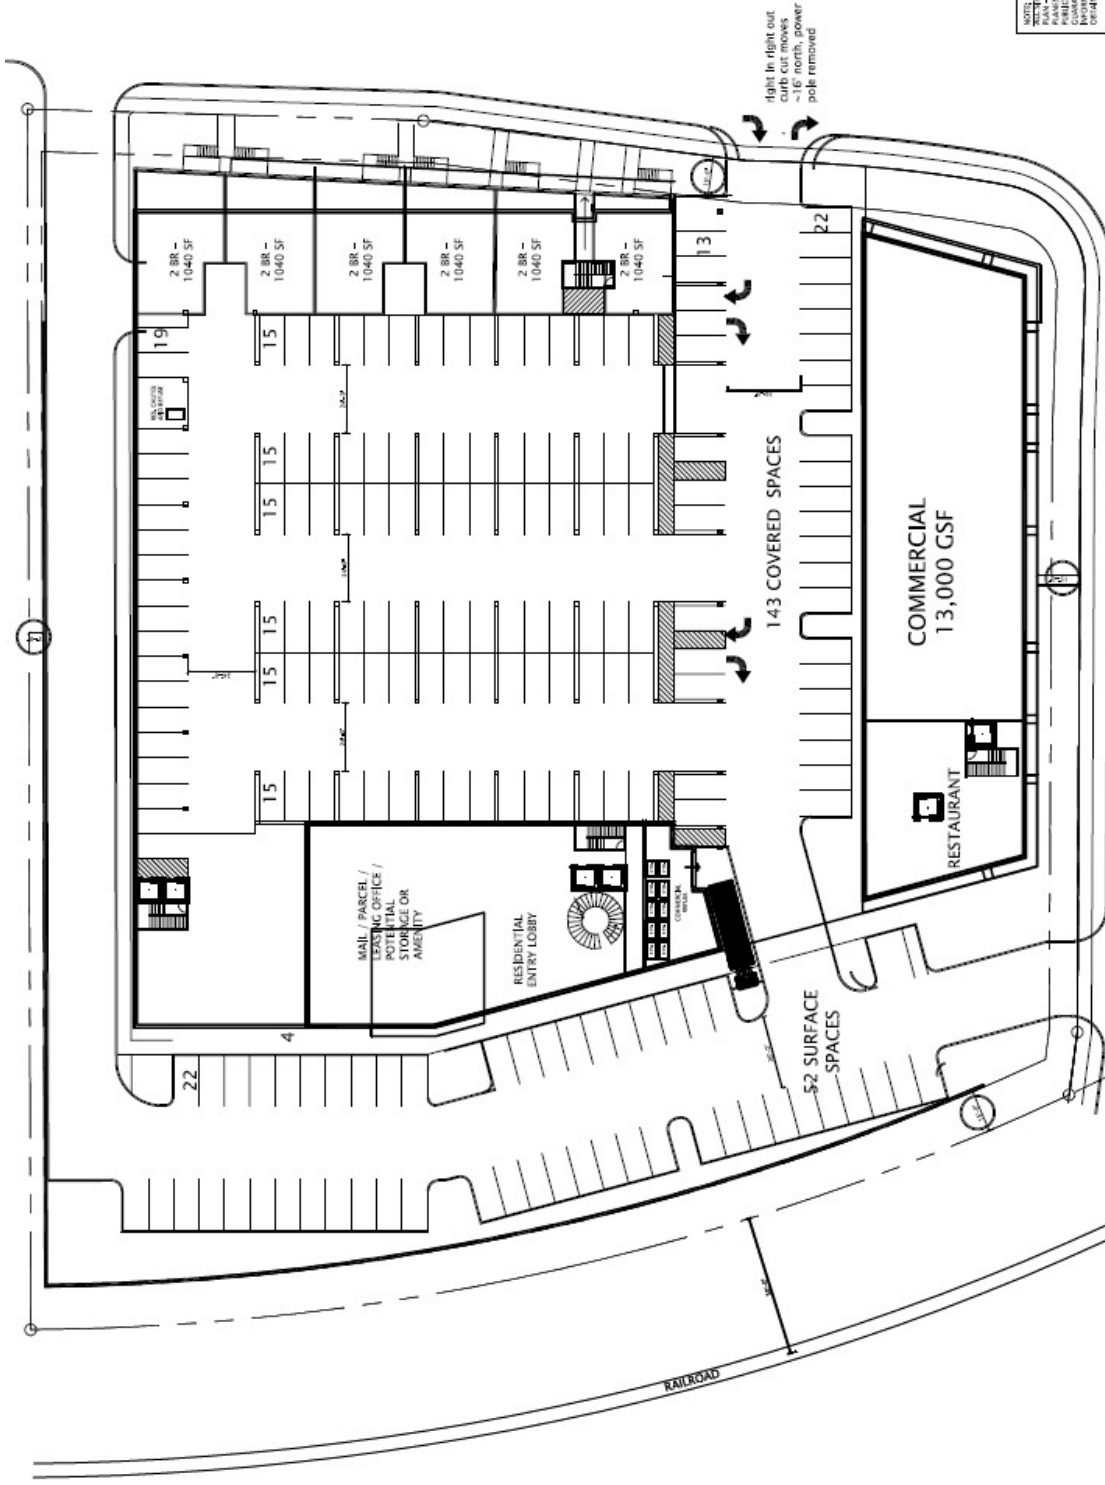

Based on the projected traffic volumes and with the recommended modifications as shown on Exhibit 9, all three site driveway connections are expected to operate acceptably with stop sign control on the development site approach under full build conditions. In addition, minor traffic signal timing modifications would benefit traffic operations at the East Washington Avenue intersection with First Street. All movements at the study area intersections are expected to operate safely and efficiently with the modifications identified in this TIA through the opening year and with full buildout and full occupancy of the proposed development.

#### Intersection Summary

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

# HCM 6th Signalized Intersection Summary

### Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

### Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 65 (72%), Referenced to phase 2:NBT and 6:SBT, Start of Yellow

Natural Cycle: 60

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.62

Intersection Signal Delay: 20.6

Intersection LOS: C

Intersection Capacity Utilization 58.9%

ICU Level of Service B

Analysis Period (min) 15

Splits and Phases: 100: E Johnson Street & First Street

## Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

# HCM 6th Signalized Intersection Summary

## Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

# HCM 6th Signalized Intersection Summary

## Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

### Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 5 (6%), Referenced to phase 2:SBTL and 6:NBT, Start of 1st Green

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.06

Intersection Signal Delay: 35.5

Intersection LOS: D

Intersection Capacity Utilization 88.3%

ICU Level of Service E

Analysis Period (min) 15

Splits and Phases: 500: E Washington Ave & First Street

Build PM Peak with modifications

## Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

# HCM 6th Signalized Intersection Summary
