

Habitat Management Plan

Cherokee Marsh Conservation Park South Unit

November 10, 2025

Photo credit: Jan Axelson

Plan originally adopted in 2018.

Site information

Address: 802 Wheeler Road

Acreage: 240 acres. This includes contiguous and non-contiguous parcels located within the City of Madison both north and south of the Yahara River

Watershed: Upper Yahara River, Lake Mendota

Site summary: Prior to its acquisition by the City in the mid 1960s, the uplands within Cherokee Marsh – South Unit (South Cherokee Marsh) were used for agriculture, and sand and gravel mining. Major restoration to date has included converting fallow agricultural land to tallgrass prairie and removing invasive woody species from overgrown oak woodlands. The park offers 3 miles of trails and a primitive boat launch with a pier and is one of six Madison parks that are groomed for cross-country skiing.

Adjacent lands: Adjacent natural areas and areas of ecological significance include a 23-acre parcel owned by the Wisconsin Department of Natural Resources, and Yahara Heights County Park.

Madison Parks' Land Management Plan (2023) defines land cover categories found in the City's parklands and provides general parameters for their management. That document provides a foundation upon which more detailed, site-specific work plans can be built. The natural areas of the park include:

Tallgrass Prairie and Oak Savanna
Urban forest – *Woodlands*
Wetlands and Waterfronts – *River and lake shorelines*
Wetlands and Waterfronts – *Ponds*
Wetlands and Waterfronts – *Emergent Marsh*
Wetlands and Waterfronts – *Sedge Meadows*
Wetlands and Waterfronts – *Shrub carr*

These land cover categories are delineated on a map in Appendix A, Figure 2.

Numerous sources have studied and written about the resources of and threats to Cherokee Marsh on scales ranging from the entire watershed to single management units within the conservation park, and from various perspectives such as hydrology, ecology, botany and public policy. The focus of this management plan is the restoration of the natural areas within the conservation park.

Conservation values

Madison is located in the Southeast Glacial Plains Ecological Landscape as defined by the Wisconsin Department of Natural Resources (WDNR) in [The Ecological Landscapes of Wisconsin](#) (2015). The park itself is located within the limits of the ancient Glacial Lake Yahara, and is in the present-day Upper Yahara River watershed, upstream of Lake Mendota.

The dominant natural features of Cherokee Marsh – South Unit (the South Unit) include the expansive wetland complexes, three artificial ponds constructed for storm water management, and uplands dominated by oak woodland and tallgrass prairie.

Several remnant plant communities occur in each of these habitats, and work has focused on protecting and expanding these high-quality areas. Work in wetlands and uplands has focused on invasive species removal, re-establishment of native plant communities, and prescribed burning. The size of this natural area is important for wildlife, as is the diversity of habitats present.

The land cover and habitats at Cherokee Marsh South Unit can be further described as the following recognized Natural Communities, described by the Wisconsin Natural Heritage Inventory:

Southern Dry Forest
Southern Dry-Mesic Forest
Southern Mesic Forest
Oak Woodland

Mesic Prairie
Wet-Mesic Prairie
Wet Prairie
Calcareous Fen

Southern Sedge Meadow
Shrub-Carr
Emergent Aquatic
Pond (see Aquatic Features)

These reference communities provide benchmarks that help guide ecologically appropriate restoration efforts. They help define more technical and specific restoration targets based on the ecology of Wisconsin. Descriptions are found at: apps.dnr.wi.gov/biodiversity/Home/Index/Communities.

Soil types include Houghton muck and Adrian muck in the large wetland complexes, silt loam on most uplands, and sandy loam on the higher ground that extends northward through the center of the property (Daryl's Woods, Bluebird Hill, and the Boat Launch Hill). A map and chart of the soils found at Cherokee Marsh South Unit is found in Appendix A, Figure 3.

Extensive use of web-based data collection platforms such as iNaturalist and eBird by local experts has allowed compilation of inventories for several taxa. 274 native species of vascular plants have been documented in the park. A total of 210 bird species have been documented, including 32 species identified as Species of Greatest Conservation Need (SGCN) in Wisconsin's Wildlife Action Plan (DNR 2015). This includes the state-endangered Peregrine Falcon, and Black, Caspian, and Common Terns, the state-threatened Red-shouldered Hawk, Great Egret, Henslow's Sparrow, and the Cerulean, Hooded, and Kentucky Warblers. Breeding pairs of the Red-Headed Woodpecker regularly nest within the park. 199 species were most recently observed within the past five years, and the remainder since 2006.

Several species of mammals, reptiles, amphibians, and insects have been documented from the park as well, including river otter, northern leopard frog, Blanding's turtle, three imperiled species of bat, and the Rusty Patched Bumble Bee which is listed as federally endangered. Appendix B contains lists of plant and animal species that have been documented to date.

Ecological threats

Fire suppression – Although fire management has increased in recent years, a legacy of fire suppression has resulted in mesophication of woodlands and woody species encroachment and succession in prairies and sedge meadows. Woodland canopy cover is dense enough to prevent oak regeneration and suppress herbaceous species diversity in some areas. Fire intolerant species have grown into the sub-canopy and overstory, shading and competing with older oak trees.

Invasive species – Major non-native plant species include reed canary grass, hybrid cattail, common reed, buckthorn and honeysuckle. Bird's-foot trefoil, garlic mustard, Japanese hedge parsley, and sweet clover are also present in significant numbers. Monk Parakeets (*Myiopsitta monachus*) have been observed in neighboring residential areas and have the potential to establish large colonies that could compete with native bird species. This non-native species has been moving farther north for several decades and is a prohibited invasive species under Wisconsin's NR40 Invasive Species rule.

Storm water pollution – Storm water runoff has delivered heavy salt and nutrient loads to the wetlands. Although some storm flow has been re-routed through a series of ponds that have been constructed in more recent years (2012-2018), runoff continues to flow from WI Hwy 113 into the west end of the marsh. This pollution here, and its legacy in the other portions of the marsh, has resulted in the replacement of sedge meadows by monocultures of reed canary grass, hybrid cattail and common reed.

Overabundant wildlife – White-tailed deer populations are very large in and around Madison, particularly on the north side of the City and northeast into the villages of Windsor and DeForest. Low hunting pressure and relatively low natural mortality contribute to population growth. The Parks Division contracts the U.S. Department of Agriculture - Animal and Plant Health Inspection Service (USDA-APHIS) to conduct annual harvests by sharpshooting. Effort in recent years has focused on the North Unit and the Mendota Unit, while little activity has been observed during the winter at the South Unit.

Foraging – Collecting wild foods has become very popular in recent years, and Parks staff frequently encounter park users off trail and engaged in collecting edible plants, fruits, and mushrooms. While City ordinances are referenced in the rules signs posted at each conservation park, many people are either unaware of or outright disregard the prohibition on collecting any natural object from conservation parks. Despite sustainable practices that may be employed by some foragers individually, the sheer number of visitors to Madison's conservation parks collectively would outweigh any effort to conserve populations and habitats.

Conservation goals

1. Restore and maintain existing woodlands.

Much progress has been made in restoring areas characterized as Oak Woodland, Southern Dry Forest, and Southern Dry-Mesic Forest throughout the park. Dense invasive shrub understories have been removed, and herbaceous invasive species populations are declining. Next steps include maintaining appropriate overstory and mid-story canopy cover to allow establishment of native shrub regeneration and oak seedlings and sustainable recruitment into larger size classes, thus ensuring continued woodland cover.

In woodlands characterized as Mesic Forest and dominated by mesic and fire-intolerant tree species, work is still needed to remove invasive understories and balance tree species composition to ensure a diverse, sustainable diameter distribution of longer-lived species. More work is needed to restore the herbaceous plant communities in these mesic woodlands.

2. Restore and maintain native herbaceous plant diversity and natural community vegetation structure.

Management objectives and prescriptions should consider both species and habitat diversity, and ensure that actions result in a heterogeneous landscape. For example, variability in the timing and frequency of prescribed burns will ensure optimal herbaceous plant diversity in prairies. Likewise,

woody species removal efforts should create or retain a variety of species, seral stages, and stem densities, and canopy cover.

3. Conserve animal diversity.

Continue to support animal research and respond to new information. While management efforts will generally focus on habitat diversity to support a wide array of wildlife species, attention will be given to ensuring specific requirements are met when possible to do so at the scale of the park. For example, prescribed burns can be scheduled and implemented to always retain areas that have at least two years of grass litter accumulation for Henslow's Sparrow nesting. Similarly, snags can be retained and aspen clones managed to complement natural tree mortality to provide sufficient snag density for Red-headed Woodpeckers. Large snags and mature live trees both support roosting sites for several bat species, and the surrounding wetlands and diverse native plant communities provide water and abundant insect populations.

4. Restore and maintain sedge meadows and shrub carr habitats.

Portions of the riverine marsh complex have been degraded and invaded by monocultures of reed canary grass, common reed, and hybrid cattail. Shrub carr habitat has been invaded by buckthorn and tree species are becoming established due to a history of fire suppression. Opportunities exist to convert reed canary grass back to sedge meadow and wet prairie. Increased prescribed fire frequency, along with targeted woody species management will help sustain shrub carr habitat.

Cherokee Marsh South Unit has been included in planning for a major effort to map and control the invasive strain of common reed (*Phragmites australis*) across ownerships throughout the Cherokee Marsh complex.

Management considerations

Madison Parks' vision is "to provide the ideal system of parks, natural resources and recreational opportunities which will enhance the quality of life for everyone." Ord. 8.40, Preservation of Conservation Parks, includes, "It is important to the residents of Madison that the City preserve Madison's native landscapes, its plant and animal populations for residents' careful use and full enjoyment."

In pursuit of this, we strive to balance ecological management needs with the needs of the community. These needs include a system of trails to support nature recreation such as hiking and cross-country skiing. They also include the placement of municipal infrastructure including storm water ponds, a sewer pump station, and a waste oil facility. In 2018, the waste oil facility, which had been located partly on park land, was moved to a right-of-way adjacent to a parking area shared by users of the waste-oil facility and park visitors.

Management decisions and actions at the South Unit should consider the following:

Prairie-dependent insects and grassland nesting birds – Proper fire regime (frequency and rotation) is critical to maintaining diverse populations of prairie-dependent insects, and habitat for grassland-nesting birds such as Henslow's Sparrows and Grasshopper Sparrows.

Red-headed Woodpecker populations - Red-Headed Woodpeckers (RHWO) have been observed in the park and regularly nest northeast of the intersection of Wheeler Road and School Road. Canopy management activities in woodlands will follow Madison Parks' internal Snag Protection Policy, which incorporates a snag inventory to monitor this habitat feature.

Engineered stormwater infrastructure – While beaver activity would actually support the goals of managing some wet prairie, sedge meadow and shrub carr habitat, damming in stormwater pond outlets will prevent their function as designed. The Engineering and Parks Divisions are cooperating to install devices that allow beaver activity while preserving drainage. We expect the beaver to have a desirable effect on woody species abundance.

Friends of Cherokee Marsh

Established in 2007, the Friends of Cherokee Marsh have become integral to the management of Cherokee Marsh. They lead monthly tours and organize volunteer workdays each year to promote the park and support Parks staff in ecological management and restoration. Their volunteers document more than 400 hours of labor annually, in addition to many volunteer hours not documented.

Parks staff and the Friends communicate regularly, and together, they coordinate work plans and priorities as they implement the habitat management plan. The Friends involve and engage new park users and active stakeholders, and regularly work on invasive plant removal, native plant establishment, and vegetation monitoring.

Management history

Major restoration work to date has focused mainly on restoring the upland portions of the park through invasive species removal, re-establishment of native plant communities, and prescribed burning. Specific projects have included converting former agricultural land to prairie and removing invasive woody species from overgrown oak woodlands. Emergent aquatic plants have been established in the artificial storm water ponds and invasive plant species have been controlled in the surrounding, revegetated basins. Ongoing management of invasive species has reduced populations of bird's-foot trefoil, buckthorn, dame's-rocket, garlic mustard, bush honeysuckle, Japanese hedge parsley, and wild parsnip on a large proportion of the uplands in the park.

Construction of a sanitary sewer main in 1971 destroyed a portion of a fen located north of the sewer pump station. Attempts were made to return the excavated material and reestablish the native plant community here, but high water levels limited the success of this effort. The fen is still monitored by UW researchers.

More recent accomplishments (since 2018) include:

- Major efforts to thin canopy and remove woody debris in the West Unit, Daryl's Woods, Wheeler Woods and East Woods units.
- Establishment of permanent vegetation monitoring transects.
- Conversion of selected small areas dominated by reed canary grass to diverse native prairie vegetation.
- Continued implementation of prescribed burns. See Appendix A, Figure 4 for a map of recent prescribed burns.

Volunteers sampling vegetation

Wheeler Woods restoration

Prescribed burn April 2025

Management units

The park can be divided into several management units to facilitate implementation of management. See Appendix A, Figure 5, for a map of management units.

West Unit (25 ac) This unit encompasses a range of habitats and is bounded by Hwy 113 to the west, DNR land to the north, and a residential area to the south. Woodland restoration efforts began in the northern part of this unit (the “White Oak Loop”) in 2014, then were expanded in 2023 to include wet-mesic woods along Hwy 113 and the upland north of Deb’s Road.

West Marsh Complex (73 ac) Riverine marsh complex dominated by sedge meadow and shrub-carr with some small pockets of calcareous fen and emergent marsh. This unit is situated along the south side of the Yahara River and also borders the adjacent DNR land to the northwest.

Wheeler Prairie Unit (15 ac) Upland prairie restoration in the western portion of the park. Wild parsnip and sweet clover have been greatly reduced in this unit in recent years.

Daryl’s Woods Unit (12 ac) Features oak woodland, sedge meadow, and two ponds.

Bluebird Hill Unit (16 ac) Upland dominated by tallgrass prairie, with oak woodland on the north-facing slope. The prairie features conservative species such as painted cup and prairie parsley. This unit includes a former borrow pit/sand mine on the south-facing slope and is separated from the Central Woods unit by the hiking trail.

Central Woods Unit (15 ac) Transitions from oak and hickory along the southern edge, to black cherry and hackberry, then cottonwood, silver maple, black willow and ash, along the stream to the north. This unit is heavily infested with buckthorn, garlic mustard, dame’s rocket and reed canary grass. Management of this unit began in 2022 with removal of buckthorn and honeysuckle, followed by prescribed grazing and limited effort to control herbaceous invasive species. More work is needed to establish a sustainable natural community.

Boat Launch Hill Unit (8 ac) Located on a ridge that separates the West Marsh and East Marsh, this unit features a prairie restoration on the hill and the boat launch on the canal.

Ilene Pond Unit (11 ac) High-quality prairie restoration adjacent to a 3.8-acre pond with abundant emergent aquatic vegetation. The east side of the unit features a swale and several cottonwood snags in which Red Headed Woodpeckers regularly nest.

Wheeler Woods (12 ac) Open wet-mesic oak woodland adjacent to a storm water pond. The woodland supports significant natural oak regeneration, and the pond is surrounded by robust prairie vegetation.

East Marsh Complex (44 ac) Sedge meadow and emergent marsh in the northeast corner of the park divided by two buried storm water outfalls that each create strips of upland occupied by tallgrass prairie. This unit is bordered by Wheeler Woods to the south and a canal to the north.

East Woods Unit (8 ac) Located at the corner of Wheeler Rd. and Comanche Way, this unit features mowed turf along the road frontage and a low-quality mesic forest heavily invaded by honeysuckle, dame’s rocket and hedge parsley. Management of this unit began in 2024 with forestry mowing followed by prescribed grazing. Herbicide treatments to invasive herbaceous species are planned, along with seeding to augment the native herbaceous layer.

Cherokee Park Unit (5 ac) Located along the south bank of the river between the canal and Cherokee Park. This unit is dominated by reed canary grass and cattails, with some native sedge meadow habitat still present. The southern portion of the unit is dominated by cottonwoods and black willow with buckthorn, honeysuckle and some native shrubs in the understory. This unit has not been actively managed to date.

Yahara Heights Unit (15 ac) Located north of the Yahara River and contiguous with Yahara Heights County Park. This unit is not actively managed by City of Madison staff, but is included in planning for a major non-native Phragmites control project that will span several properties. The project is being coordinated by the South Central Invasives Partnership led by the Upper Sugar River Watershed Association.

Objectives

The following objectives are recommended to repair and sustain the natural communities at this site:

- Achieve and maintain 50%-70% overstory canopy cover, measured within individual management units, in areas characterized as Oak Woodland.
- Establish and maintain oak regeneration throughout the diameter distribution in Oak Woodland and Southern Dry-mesic Forest habitats.
- Establish and maintain sufficient tree regeneration throughout the diameter distribution in areas characterized as Southern Mesic Forest.
- Establish and maintain 10-15% native shrub cover, measured in individual management units, in wooded habitats.
- Establish and maintain native shrub dominance in areas delineated as shrub carr. This will include controlling non-native species as well as limiting the establishment of *Acer* and *Populus* species to prevent succession to forested habitat.
- Limit native woody species cover to 5% or less in areas characterized as prairie and sedge meadow.
- Re-establish native prairie vegetation in small, manageable areas currently dominated by reed canary grass, in order to help contain monocultures and provide anchor points for larger reed canary grass removal projects.
- Initiate larger scale reed canary grass removal projects in wetland areas contained by physical boundaries such as topography or adjacent human-created cover types (turf, roads, etc.).
- Burn tallgrass prairie and sedge meadow units on 3-year return interval, allowing a minimum of 2 years thatch to accumulate and remain present on a portion of the park at all times. Alternate timing of upland grassland burns to retain availability of appropriate nesting habitat for grassland birds. Burn no more than ½ of prairie habitat in one season to conserve invertebrate diversity.
- Burn woodland units on a 5-year maximum return interval.

Specific Management Unit Prescriptions:

Timeline	Unit	Task
Fall 2025	Central Woods	Conduct tree and snag inventory
Winter 2026	Central Woods	Buckthorn removal, canopy thinning to release sub-canopy dominants and allow recruitment of diverse species
	Daryl's Woods	Selective canopy removal to release oaks along Wheeler Road
	Bluebird Hill	Remove red pines from southern rim
	Cherokee Park Unit	Invasive shrub removal (contract)
Spring 2026	East Marsh Wheeler Woods Ilene Pond	Rx burn
	Ilene Pond	Sow grass hemiparasites in prairie near trailhead kiosk

Timeline	Unit	Task
Spring 2026 (continued)	West Unit Daryl's Woods Central Woods Wheeler Woods East Woods	Garlic mustard, dame's rocket, and hedge parsley control in wooded areas- includes contracts for West Unit, Central Woods and East Woods
	Daryl's Woods Central Woods	Mow reed canary grass
	Central Woods	Plant native shrub species along stream (in place of former buckthorn thickets)
	Wheeler Prairie	Mow sweet clover, wild parsnip
Summer 2026	West Marsh	Determine feasibility of reed canary grass control west of Daryl's Woods unit.
	West Marsh East Marsh Cherokee Park Unit	Phragmites treatments under CISMA project
	East Woods West Unit	Prescribed graze
	Wheeler Woods	Reed canary grass control contract
	East Marsh	Cattail control (contract)
	Boat Launch Hill	Establishment mow former RCG areas
	Daryl's Woods Central Woods	Mow and spray RCG areas
	Wheeler Prairie	Mow and spray silver grass
Fall 2026	Daryl's Woods Bluebird Hill	Conduct tree and snag inventory
	East Woods	<ul style="list-style-type: none"> • Spray biennial invasive species • Sow woodland graminoids
	Bluebird Hill Daryl's Woods Central Woods (RCG control areas)	Rx burn
	Bluebird Hill	Seed woodland mix post-burn
	Daryl's Woods Central Woods	Sow seed mix in former RCG areas
Winter 2027	West Unit Central Woods	Complete buckthorn removal
	West Marsh	Tree species control in shrub carr habitat
	Central Woods	Industrial and woody debris removal in E portion of unit
Spring 2027	West Unit Wheeler Prairie	Rx burn
	West Unit Daryl's Woods Central Woods Wheeler Woods East Woods	Garlic mustard, dame's rocket, and hedge parsley control in wooded areas- includes contracts for West Unit, Central Woods and East Woods
	Central Woods	Plant emergent aquatic and obligate wetland herbs along stream corridor
	East Marsh	Plant emergent aquatics in former cattail stands

Timeline	Unit	Task
Summer 2027	West Marsh	Reed canary grass control contract
	West Marsh East Marsh Cherokee Park Unit	Phragmites treatments under CISMA project
	West Marsh	Cattail control north of lift station (staff and volunteers)
	West Unit	Determine feasibility of reed canary grass control in marsh
Fall 2027	West Unit East Woods	Conduct tree and snag inventory
	West Marsh	Rx burn (*At least the RCG treated area if not entire unit)
	West Unit	Sow native seed mix in woodlands prior to leaf drop
	East Woods	Spray biennial invasive species
Winter 2028	East Woods	Canopy management to create sustainable diameter distribution.
Spring 2028	East Marsh Boat Launch Hill Cherokee Park Unit	Rx burn
	West Unit Daryl's Woods Central Woods Wheeler Woods East Woods	Garlic mustard, dame's rocket, and hedge parsley control in wooded areas
Summer 2028	West Unit	Reed canary grass control contract
	East Marsh	Cattail control (contract)
Fall 2028	West Unit	<ul style="list-style-type: none"> • Rx burn • Sow seed mix in former RCG areas
Winter 2009	West Unit	Canopy management in woodlands
Spring 2029	Central Woods Ilene Pond	Rx burn
	East Marsh	Plant emergent aquatics in former cattail stands
	West Unit	Plant native shrubs and deer-resistant native herbaceous species in woodlands
	various	Follow-up maintenance level invasive species control
Summer 2029	Daryl's Woods	Cattail control (staff)
Fall 2029	Wheeler Prairie	Rx burn
	East Woods	Sow native woodland forb seed mix
Winter 2030	various	Follow-up maintenance level woody invasive species control
Spring 2030	West Unit Central Woods East Woods	Augment natural tree regeneration with bare-root seedlings where needed
	various	Follow-up maintenance level invasive species control
Summer 2030	East Marsh	Reed canary grass control contract
Fall 2030	East Marsh	<ul style="list-style-type: none"> • Rx burn • Sow seed mix in former RCG areas
	Bluebird Hill	Rx burn
	West Unit	Sow native woodland forb seed mix

In addition to the actions outlined above for stewardship of this natural area, the following initiatives would advance the restoration trajectory of the park, resulting in greater benefit, achieved sooner. These actions would be accomplished through implementation of capital improvement projects, special initiatives directed at a specific goal, or a general, longer-term increase in resources, including volunteer labor.

- Collect and sow acorns to assist regeneration of white and bur oaks.
- Plant bare root and non-dormant herbaceous plants in woodland units, particularly in wooded portions of the West Unit, Central Woods, and East Woods units.
- Plant additional native shrub and understory tree species in limited numbers in areas that had been overgrown with non-native shrubs and recently re-set (cleared). Target areas would include the East Woods, Central Woods, and the portion of the West Unit along Hwy 113

Monitoring and Evaluation

Measuring results is critical to determining success. Refer to Appendix C for an outline of the goals for monitoring natural areas in Madison Parks.

Parks staff currently have very limited capacity to conduct monitoring. However, Parks is supported by a network of volunteers and researchers. Community science programs are available to collect data on sensitive ecological indicators and provide crucial information on which to base management decisions. Many of the programs listed below are currently implemented in other conservation parks, and with the recent addition of Parks staff to support volunteer engagement, these can be further implemented at Cherokee Marsh as well.

Program	Coordinator	Website
Bluebird Trail (currently implemented at Cherokee Marsh)	Bluebird Restoration Association of Wisconsin	braw.org
Wisconsin Bat Program	Wisconsin Department of Natural Resources	wiatri.net/inventory/bats/
Wisconsin Bumble Bee Brigade	Wisconsin Department of Natural Resources	wiatri.net/inventory/bbb/
Wisconsin Odonata Survey	Wisconsin Department of Natural Resources	wiatri.net/inventory/odonata/
Wisconsin Frog and Toad Phenology Survey	Wisconsin Department of Natural Resources	wiatri.net/inventory/frogtoadsurvey/
Friends of Amphibians	Hua Lab, UW Madison	jhua13.wixsite.com/jhua
Integrated Monarch Monitoring Program	Monarch Joint Venture	monarchjointventure.org/mjvprograms/science/integrated-monarch-monitoring-program
Monarch Larva Monitoring Program	Monarch Joint Venture and UW Madison Arboretum	mlmp.org/

Open-source data collection platforms such as eBird and iNaturalist provide valuable information on species occurrences. Staff access datasets through the Global Biodiversity Information Facility (GBIF.org), and use them to compile species inventories for the parks.

In addition, volunteers monitor vegetation along permanent transects, using a protocol where plant species richness and cover is measured in randomized square-meter quadrats. This data is stored and maintained by Parks staff and is used to calculate diversity and floristic quality. See Appendix A, Figure 6 for a map of vegetation monitoring transects.

Vegetation surveys have been conducted by volunteers since 2019. Three permanent transects have been established in Cherokee Marsh South Unit. Along each transect, 1-meter by 1-meter quadrats are randomly located and all plant species present are recorded and percent cover estimated for each species. This data has been compiled and analyzed to track changes in the plant community over time within specific management units. Initial results are summarized in Appendix D. Many more years of data are needed to overcome the small sample size and inherent variability of the site to truly discern trends. However, initial data from the three years included in Appendix D show relative stability in floristic quality and diversity of all transects at Cherokee Marsh South Unit.

Additional monitoring needs include:

- Tree species recruitment and diameter distribution in woodlands
- Canopy cover in woodlands, measured at different heights
- Total woody species cover in prairie
- Mammal and amphibian inventories

Budget

The work outlined in this plan is accomplished through financial and in-kind support from the City's General Operating budget, special Capital Improvement Project funding, and volunteer labor.

Typical Annual Budget Estimate:

Task	Labor required (hours)	Annual cost
Prescribed burning (2 days, 8 person crew)	160	\$5,600
Native seed mix and growing stock	-	\$5,000
Native plant establishment (\$20/hr)	100	\$2,000
Invasive species control (\$30/hr)	400	\$12,000
Contracts for invasive species control and canopy management	-	\$35,000
Monitoring (\$25/hr)	300	\$7,500
Trail maintenance and repair (\$20/hr plus materials)	150	\$4,000
Totals		\$71,100

Hourly rates reflect average staff wages and volunteer "in-kind" rates.

Web Soil Survey URL:

Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Dane County, Wisconsin

Survey Area Data: Version 24, Sep 10, 2025

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jun 13, 2020—Sep 13, 2022

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
629A	Orion silt loam, wet	12.3	4.5%
7009A	Houghton muck, 0 to 2 percent slopes	35.8	13.1%
7030A	Adrian muck, 0 to 2 percent slopes	93.2	34.0%
7105A	Batavia silt loam, gravelly substratum, 0 to 2 percent slopes	1.7	0.6%
7105B	Batavia silt loam, gravelly substratum, 2 to 6 percent slopes	4.4	1.6%
7122B	Westville silt loam, 2 to 6 percent slopes	4.1	1.5%
7204A	Virgil silt loam, gravelly substratum, 0 to 3 percent slopes	6.8	2.5%
7243B	St. Charles silt loam, 2 to 6 percent slopes	1.5	0.6%
7325B	Dresden silt loam, 2 to 6 percent slopes	3.9	1.4%
7325C2	Dresden silt loam, 6 to 12 percent slopes, eroded	13.8	5.0%
7327B	Kegonsa silt loam, 2 to 6 percent slopes	22.4	8.2%
7374A	Radford silt loam, 0 to 3 percent slopes	3.5	1.3%
7506A	Wacousta silty clay loam, 0 to 2 percent slopes	7.2	2.6%
7706D2	Boyer sandy loam, 12 to 20 percent slopes, eroded	21.5	7.8%
M	Marsh	24.1	8.8%
W	Water	17.8	6.5%
Totals for Area of Interest		274.1	100.0%

Animals- Birds

Source: GBIF.org (28 October 2025) GBIF Occurrence Download <https://doi.org/10.15468/dl.8ktspt>

State listings:

END = endangered

THR = threatened

SC/M = special concern, but fully protected by federal and state laws under the Migratory Bird Act

SGCN = Species of Greatest Conservation Need, as identified in the Wisconsin Wildlife Action Plan

SINS-Monitoring = Species has numerical conservation status ranks and sufficient information to be assessed, but does not meet SGCN criteria.

SINS-Ranking = Species for which there is basic information, but not enough to assign a numerical rank

See Wisconsin natural heritage working list website for more information:

Appendix C. Madison Parks Natural Areas Monitoring Goals

August 2023

Monitoring is necessary to track the success of restoration efforts as well as the overall quality of the habitat being managed. Data collected can quantify results, show trends in natural area health, and reveal potential concerns. The following framework identifies some possible monitoring subjects and strategies. Objectives and tasks can be implemented and completed as staff and volunteer capacity allow.

Much information can be gained by engaging and supporting various formal community science programs, and less formal community-populated databases. Data from many of these are accessible from the individual host organizations, as well as through clearing houses such as the [Global Biodiversity Information Facility \(GBIF\)](#). Many volunteers currently conduct monitoring within conservation parks and other natural areas. These programs are recognized below as well.

Taxa: Plants

Objectives:

1. Complete and update species inventories for each park, and each management unit where applicable (Managed Meadow, Woodland, management unit within a conservation park, etc.).

Tasks:

- a. Conduct meander surveys three times during the growing season to compile and update plant species list.

2. Determine and track floristic quality in managed natural areas

Tasks:

- a. Establish permanent transects with randomized 1m² plots (quadrats)
- b. Survey quadrats and record percent cover of each species present.
- c. Analyze data to calculate species richness, diversity, and Floristic Quality Index.

Taxa: Insects

Objectives:

1. Complete overall species inventory per park

Tasks:

- a. Conduct daytime surveys with sweep nets
- b. Conduct nighttime surveys with light traps
- c. Conduct surveys of soil surface insect fauna

2. Monitor pollinator abundance and species composition

Tasks:

- a. Collect data using [Wisconsin Bumble Bee Brigade](#) protocols
- b. Support the [Integrated Monarch Monitoring Program](#)
- c. Collect data using Pollard transects to target butterflies
- d. Support the [Wisconsin Odonata Survey](#)

Taxa: Herptiles

Objectives:

1. Complete overall species inventory per park

Tasks:

- a. Conduct surveys with funnel traps

2. Conduct breeding survey

Tasks:

- a. Establish [Wisconsin Frog and Toad Survey](#) phenology survey locations where appropriate

Taxa: Birds

Objectives:

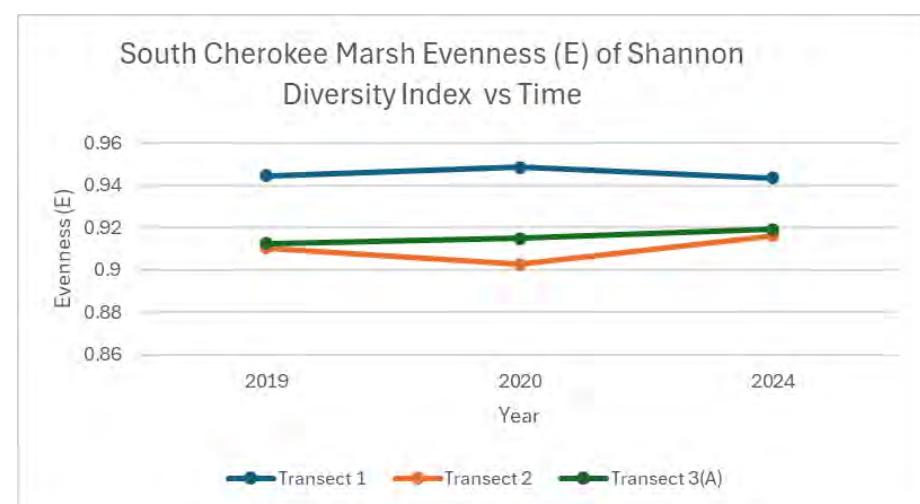

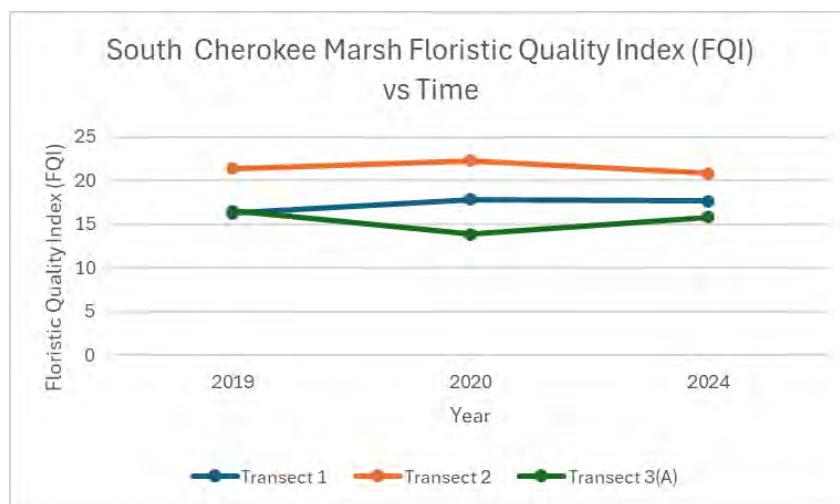

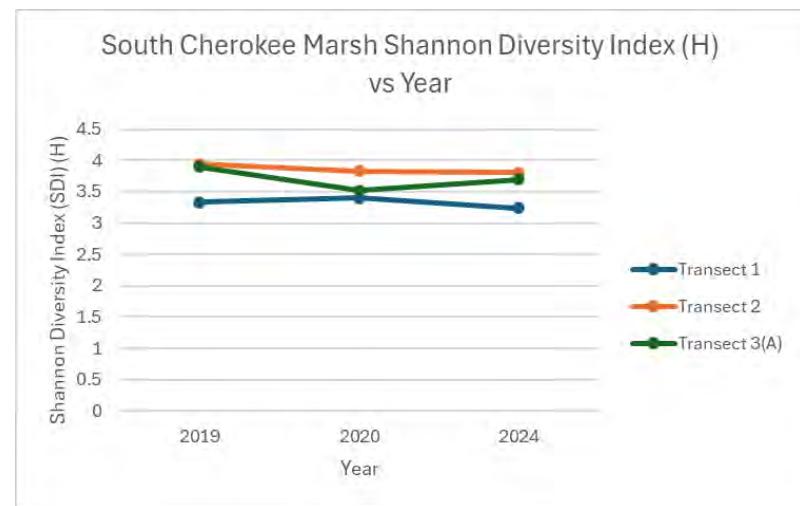

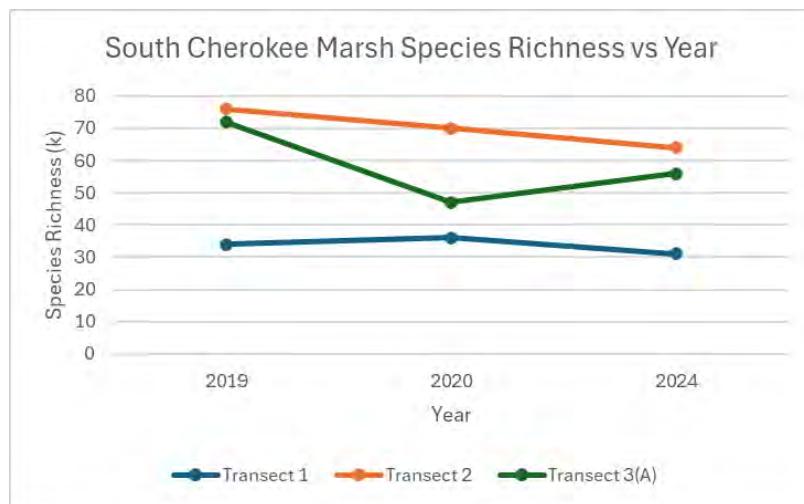

1. Conduct surveys and document species present.

2. Analyze data available from [eBird](#) through the [Global Biodiversity Information Facility \(GBIF\)](#)

Tasks:

- a. Download data sets for each park
