## 1.01 INTRODUCTION

Strand Associates, Inc.® (Study Team) performed a Traffic Impact Analysis (TIA) for the proposed Archipelago Village, LLC (Archipelago Village) Development site bounded by East Washington Avenue/US 151, Bearly Street, Main Street, and Paterson Street in the City of Madison, Wisconsin (City). The study area is shown in Figure 1.01-1. This figure illustrates the location of Archipelago Village in relation to other recent and planned developments on East Washington Avenue. The figure also highlights the intersections that will be most influenced from traffic being generated from Archipelago Village.

## 1.02 PROPOSED REDEVELOPMENT DESCRIPTION

The Archipelago Village Development Team (Development Team) proposes to redevelop the south/east side of the 900 block of East Washington Avenue. The proposed redevelopment site (site) master plan includes four access points to the site: one on East Washington Avenue (North

Access), which would be right-in/right-out only; one on Bearly Street (East Access), one on Main Street (South Access), and one on Paterson Street (West Access). The site plan is located in Appendix A. Figure 1.02-1 illustrates the proposed site plan including proposed access locations. At full build-out, Archipelago Village is planned to include:

- 68,000 square feet (sf) of commercial space
- 374,000 sf of office space
- 144-unit boutique hotel
- 152 apartment units

Figure 1.02-2 shows a possible site arrangement of the buildings.

### 1.03 PURPOSE OF THE STUDY

This study:

1. Identifies the existing (2017) traffic volumes and analyzes the existing operation of study intersections during the weekday AM and PM peak hours.
2. Develops horizon year (2037) traffic volume forecasts for the study intersections and analyzes the future operation of these intersections without Archipelago Village.
3. Performs a trip generation for the proposed Archipelago Village using trip generation rates from the *Institute of Transportation Engineer's (ITE) Trip Generation Manual*, 10th Edition, to estimate the traffic generated from the proposed development.
4. Distributes the trips from the proposed Archipelago Village and evaluates the impact of these future trips on pedestrians, bicyclists, and transit riders.
5. Evaluates future impacts the proposed Archipelago Village would have on motor vehicles with and without the proposed development.
6. Recommends improvements to better accommodate travel to and from the site.

## 1.04 SUMMARY OF EFFECTS AND RECOMMENDATIONS

### A. Trip Generation and Distribution

Trips were generated for the proposed redevelopment site using the *ITE Trip Generation Manual*, 10th Edition. A 30 percent reduction was applied to the baseline trips to account for linked trips, pass-by trips, alternate mode trips, and mixed-use trips.<sup>1</sup> Table 1.04-1 shows the AM peak hour, PM peak hour, and daily trips generated for Archipelago Village.

Daily Trips	AM Peak Hour Trips			PM Peak Hour Trips		
	AM In	AM Out	Trips	PM In	PM Out	Trips
Total New Development Trips	6,252	382	125	506	211	410
						622

**Table 1.04-1 Archipelago Village Trip Generation Summary**

The trips generated by Archipelago Village were distributed to the roadway network based on existing peak-hour turning movements of the study intersections. During the morning peak hour in 2037, trips from Archipelago Village are anticipated to make up 3 percent of the traffic on East Washington Avenue. During the 2037 evening peak hour, trips from Archipelago Village are also anticipated to make up approximately 3 percent of the traffic on East Washington Avenue.

On Williamson Street during the 2037 morning peak hour, trips from Archipelago Village are projected to make up about 9 percent of the peak-hour Williamson Street traffic. During the 2037 evening peak hour, trips from Archipelago Village are anticipated to make up between 7 and 8 percent of the Williamson Street traffic. Table 1.04-1 summarizes the trip generation from Archipelago Village. A more detailed trip summary is presented in Section 3 of this report.

### B. Travel Demand Management (TDM)

It is important to acknowledge that the site will benefit from TDM by the nature of the project and location. The mix of commercial, office, hotel, and apartment uses within the same block will reduce total external trips as well as experience peaking characteristics that vary in intensity and time of day. Furthermore, the site's contribution toward continued mixed-use redevelopment along the East Washington Avenue corridor as well the density of surrounding nearby destinations will make trips by foot, bike, and bus attractive and practical for a wide range of residents, guests, and visitors. The location of the project on the proposed east-west BRT route potentially further increases the utility of travel to and from the site by bus.

Following are specific TDM recommendations:

<sup>1</sup> Driveway counts of recent development on East Washington Avenue show trip generation rates 30 to 50 percent of those predicted by the *ITE Trip Generation Manual*, which would correspond with a 50 to 70 percent reduction. The use of a 30 percent reduction is conservative, potentially overestimating the motor vehicle traffic generated by the site.

1. The hotel, office, and apartment Web sites should include information regarding options for traveling to the site via alternate modes. This includes walking, bicycling, Metro Transit bus service (and future BRT service), taxi, and ridesharing services.
2. The property operator(s) should distribute information to residents and employees regarding options for traveling via alternate modes. In addition to walking, bicycling, Metro Transit bus service (and potentially future BRT service), taxi, and ridesharing services, this should also include the following.
  - a. The Madison Area Transportation Planning Board (MATPB) administers Rideshare, Etc. in partnership with the Wisconsin Department of Transportation (WisDOT). The program includes a Web site ([www.rideshareetc.org](http://www.rideshareetc.org)) where commuters can set up a profile and tailor searches for potential carpool partners, available vanpools, transit routes, and biking partners.
  - b. The Guaranteed Ride Home program offers commuters that do not drive alone a taxi voucher, so they are not stranded at work if an emergency arises. Up to six passes per year worth up to \$75 per ride are available. The program is administered by the MATPB and funded by the Dane County Highway and Transportation Department.
3. The property operator(s) should explore hosting a B-Cycle Bike Share service station within the development.
4. The property operator(s) should explore free or discounted B-Cycle passes to residents, employees, and hotel guests.
5. The property operator(s) should explore free or discounted Metro Transit passes to residents, employees, and guests.

C. Pedestrian and Bicycle Accommodations

The Archipelago Village site is well located for pedestrian and bicycle access. The Capital City trail lies just two blocks south, East Washington Avenue has bike lanes in both directions, and the surrounding development density supports non-motorized vehicle use. With the exception of Livingston Street south of Main Street, sidewalks exist on both sides of the blocks surrounding Archipelago Village.

If or when the recommended signalization of the East Washington Avenue and Brearly Street occurs (see motor vehicle recommendations), the Study Team recommends adding pedestrian signal heads and push buttons at this intersection. No additional alternatives are proposed external to the site.

Based on the City's requirements for off-street parking, Table 1.4-2 shows the bicycle parking spaces for this development site assuming shared use. Archipelago Village LLC is working with the City to determine the appropriate number of bicycle parking spaces. As of February 18, 2019, the proposed bicycle parking at build-out is 200 spaces.

Specified Land Use	Off-Street Parking Requirements	Shared Parking Calc	
		Daytime Use	Evening Use
High-Turnover (Sit-Down) Restaurant	5% of capacity of persons	8	9
Quality Restaurant	5% of capacity of persons	20	25
General Retail	1 per 2,000 sf	34	34
Hospital/Clinic	1 per 5 employees	2	2
General Office Building	1 per 2,000 sf	136	
Hotel	1 per 10 bedrooms	13	25
Apartment	1/unit up to 2 bedrooms; 1 guest space per 10 units	59	235
Totals		271	330
Mixed use/local trip rates reduction (-30%)		-81	-99
Adjusted Totals		190	231

Off-Street Parking Requirements from the City of Madison.

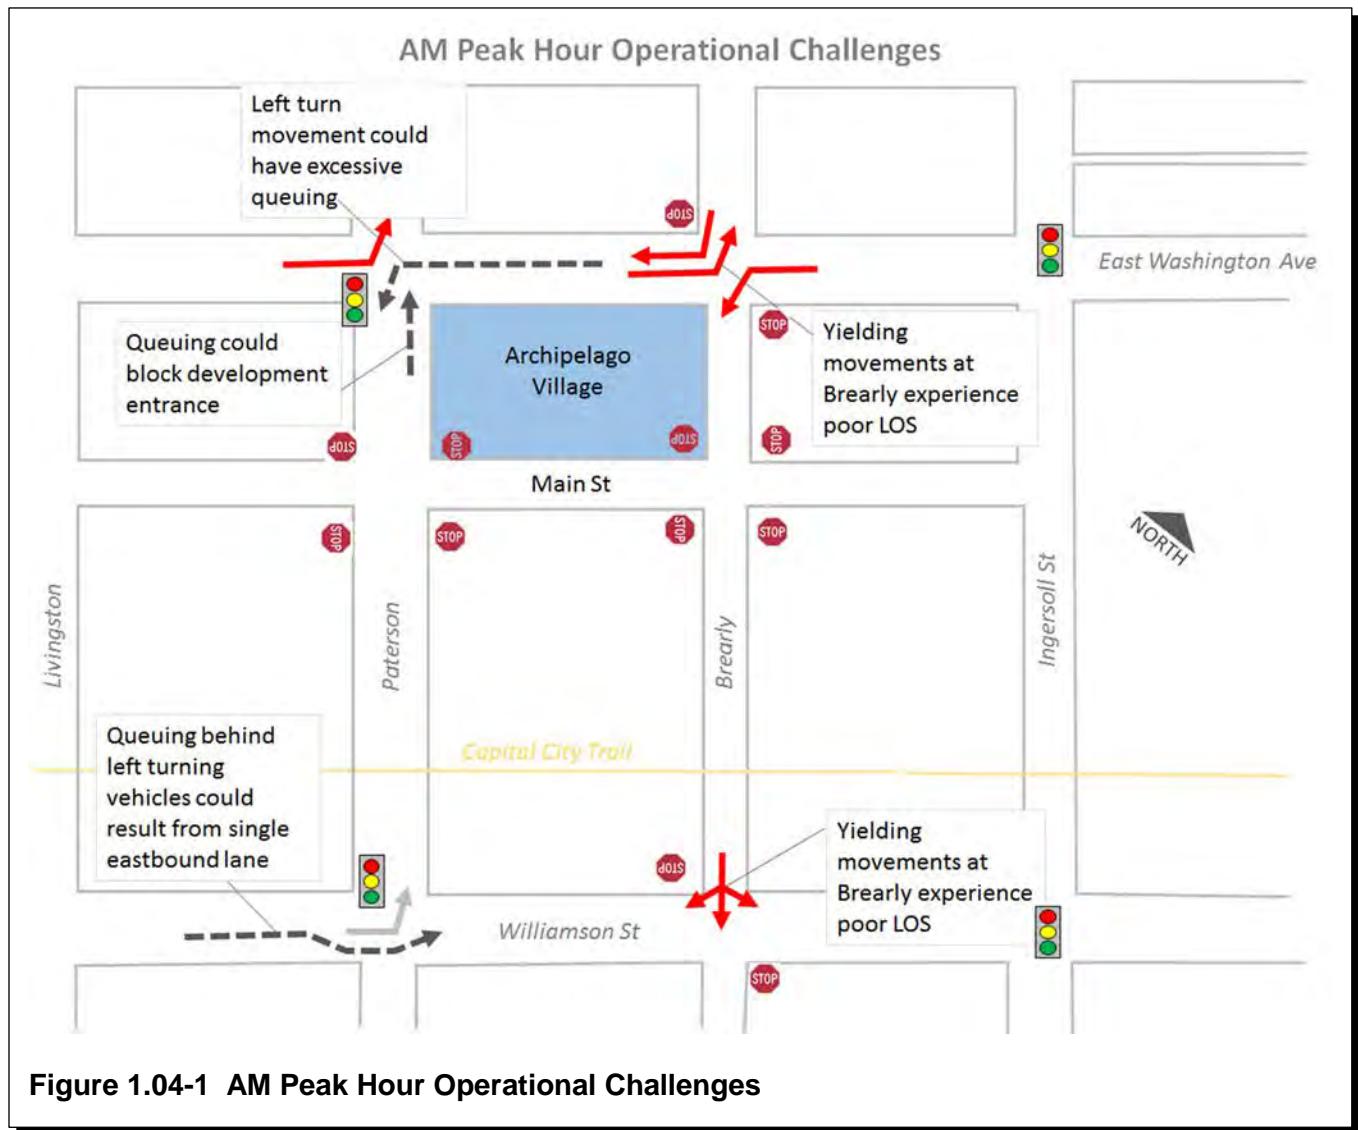

**Table 1.04-2 Archipelago Village Bicycle Parking**

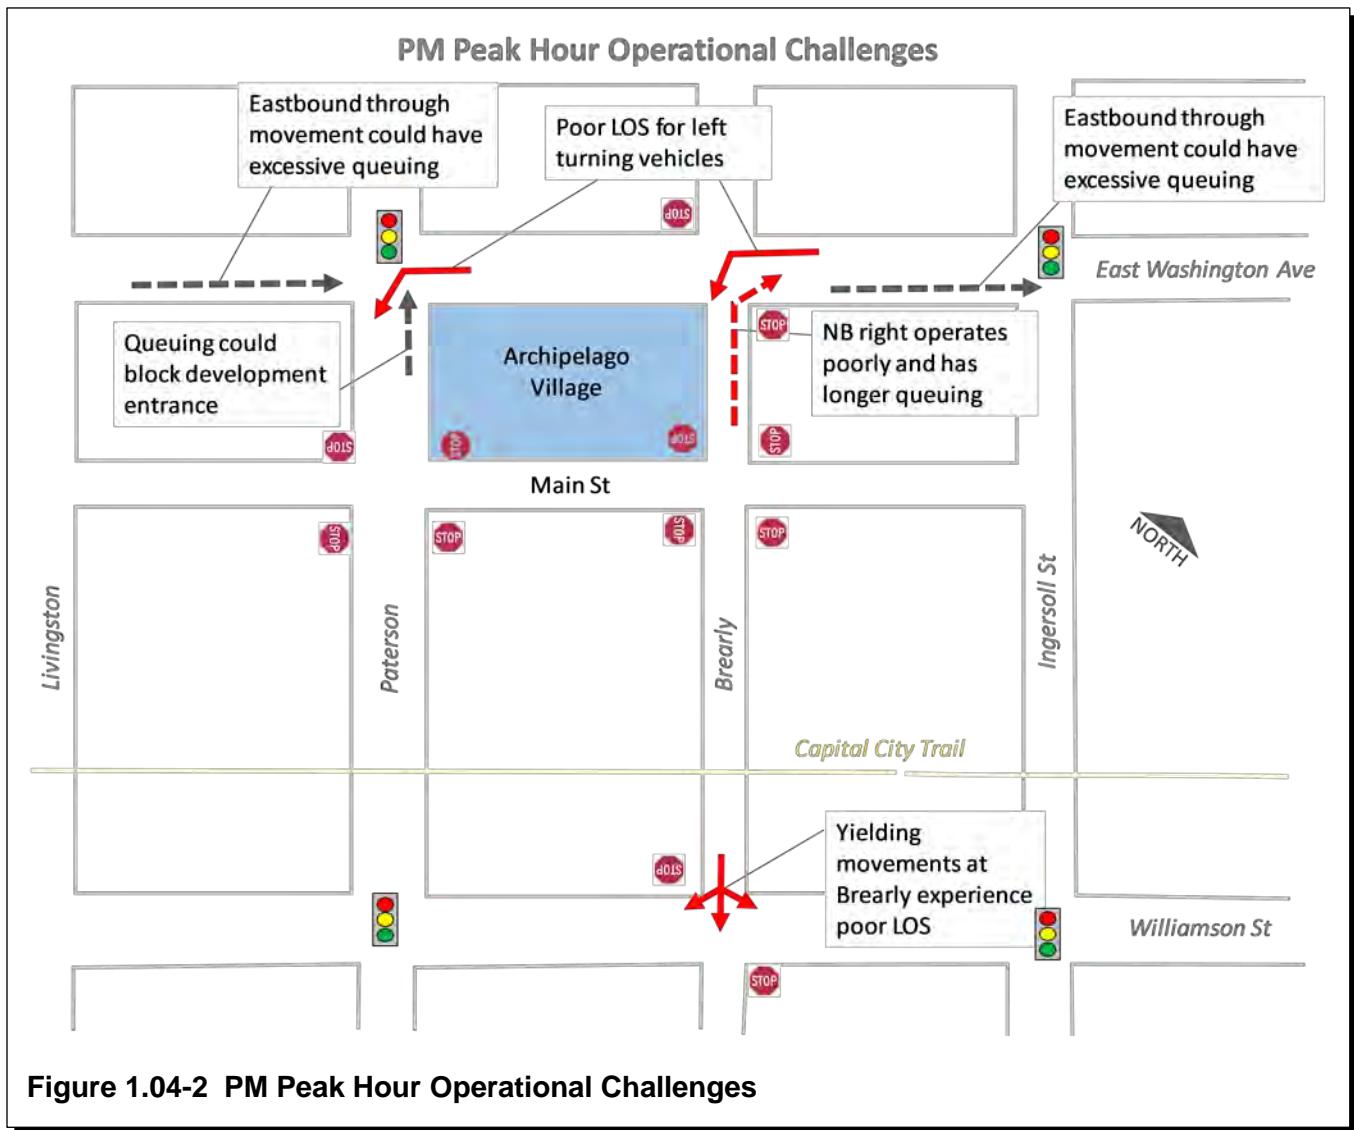

#### D. Transit

Being on East Washington Avenue, the site has high levels of transit service. Additionally, Archipelago Village is on the east-west Bus Rapid Transit routing that is currently under study.

#### E Motor Vehicles

Figures 1.04-1 and 1.04-2 graphically illustrate the 2037 Peak Hour operational challenges associated in the roadway network surrounding Archipelago Village when it is fully developed. Many of these challenges currently exist, or would exist even without the Archipelago Village development and result from the background traffic growth.

**Figure 1.04-2 PM Peak Hour Operational Challenges**

The Study Team analyzed the existing and proposed intersections at or near Archipelago Village. Some of the analyzed intersections will operate poorly with or without the proposed site. This includes the Bearly Street and Williamson Street intersection, which currently does not have signals, and it is not feasible to install signals. It is possible to mitigate much of the traffic impacts created by the Archipelago Village. Table 1.04-3 shows the AM and PM peak hour overall Level of Service (LOS) at the study intersections with the proposed geometric and control recommendations. The paragraphs following Table 1.04-3 describe the recommendations.

Location	2037 Recommended Geometric Improvements Intersection Operations					
	AM Peak Hour			PM Peak Hour		
	Overall LOS	LOS E Movement (s)	LOS F Movement (s)	Overall LOS	LOS E Movement (s)	LOS F Movement (s)
E Washington Avenue and Paterson Street (Signalized)	A	--	--	B	--	--
E Washington Avenue and Bearly Street (Signalized)	A	--	--	A	--	--
E Washington Avenue and Ingersoll Street (Signalized)	B	--	--	A	SBL/T/R	--
Main Street and Paterson Street (Unsignalized)	A	--	--	B	--	--
Main Street and Bearly Street (Unsignalized)	A	--	--	B	--	--
Williamson Street and Paterson Street (Signalized)	B	--	--	B	--	--
Williamson Street and Bearly Street (Unsignalized)	F	--	SBL/T/R	F	--	NBL/T/R, SBL/T/R
North Access (Unsignalized)	C	--	--	F	--	NBR
East Access (Unsignalized)	A	--	--	A	--	--
South Access (Unsignalized)	A	--	--	B	--	--
West Access (Unsignalized)	B	--	--	B	--	--

Note:

SBL/T/R = southbound left/through/right  
NBL/T/R = northbound left/through/right

**Table 1.04-3 2037 Intersection Operations, with Archipelago Village Development and with Recommended Geometric Improvements**

### 1. East Washington Avenue and Paterson Street

The Study Team recommends adding a northbound left-turn bay at the intersection of East Washington Avenue and Paterson Street. This left-turn bay could be accomplished by restricting parking on the northern 200 feet of Paterson Street. With this treatment, all movements operate at LOS D or better during the AM and PM peak hours.

### 2. East Washington Avenue and Bearly Street

The Study Team recommends a partial signal, similar to the one at Livingston Street that would provide signal control for the eastbound and westbound left turns at this intersection. Signalizing these left turns would also allow a northbound and southbound right-turn overlap, addressing the queuing concerns. Because this intersection prohibits north and southbound through movements, the signal could be coordinated with adjacent signals and minimize the impact of the time taken away from the East Washington Avenue coordinated through movements.

Adding a signal improves operations to LOS A during the AM and PM peak hours. All individual movements operate at LOS D or better during the AM and PM peak hours.

3. East Washington Avenue and Ingersoll Street

Despite the queuing, overall LOS remain acceptable with the development traffic. Because the overall intersection operation is acceptable, the Study Team recommends no additional improvements to the intersection of East Washington Avenue and Ingersoll Street.

4. Main Street and Paterson Street

The Main Street and Paterson Street intersection will operate acceptably as an all-way stop-controlled intersection. No further improvements are recommended.

5. Main Street and Bearly Street

The Main Street and Bearly Street intersection will operate acceptably as an all-way stop-controlled intersection. No further improvements are recommended.

6. Williamson Street and Paterson Street

The Study Team recommends extending the eastbound no parking restriction on the corner of Williamson Street to the west/upstream, which would help eastbound through vehicles bypass left-turning traffic during the AM peak hour. The Study Team coded a 50-foot turn bay to resemble the no parking restriction in the operations model, and this modification reduced the eastbound queues by 50 percent or more during the AM peak hour.

7. Williamson Street and Bearly Street

Because of the close spacing of signals on Williamson Street, the Study Team does not recommend signalizing the Williamson Street and Bearly Street intersection. Delays associated with this intersection may cause some travelers to use alternate intersections, such as Ingersoll Street, to access Williamson Street.

8. North Access and East Washington Avenue

The Study Team recommends an eastbound parking restriction on East Washington Avenue for approximately 150 feet to provide adequate sight distance for exiting vehicles.

9. East Access and Bearly Street

The Study Team recommends restricting parking on the west side of the street and shifting the centerline marking 4 feet to the west. This would allow through vehicles and cyclists the opportunity to travel around northbound vehicles making a left into Archipelago Village parking lot.

10. South Access and Main Street.

The Study Team recommends restricting parking on the north side of the street and shifting the centerline marking 4 feet to the north. This would allow through vehicles and cyclists the opportunity to travel around eastbound vehicles making a left into the Archipelago Parking lot.

11. West Access and Paterson Street.

The Study Team recommends restricting parking on both sides of the street to allow a northbound left-turn lane at the East Washington Avenue intersection, and to provide a southbound left-turn refuge for vehicles turning into the Archipelago Village Parking Lot. This likely will require a 50-foot northbound left-turn storage bay at East Washington Avenue, a 75-foot taper, and a 25-foot left-turn bay for the Archipelago Village Parking lot.

---

**SECTION 2**  
**DATA COLLECTION**

## 2.01 EXISTING DAILY TRAFFIC

The City performs traffic volume counts on city streets on a three-year cycle. The posted counts for the area near Archipelago Village were performed in 2013. Figure 2.01-1 illustrates the average daily weekday volumes for streets in the vicinity of Archipelago Village.

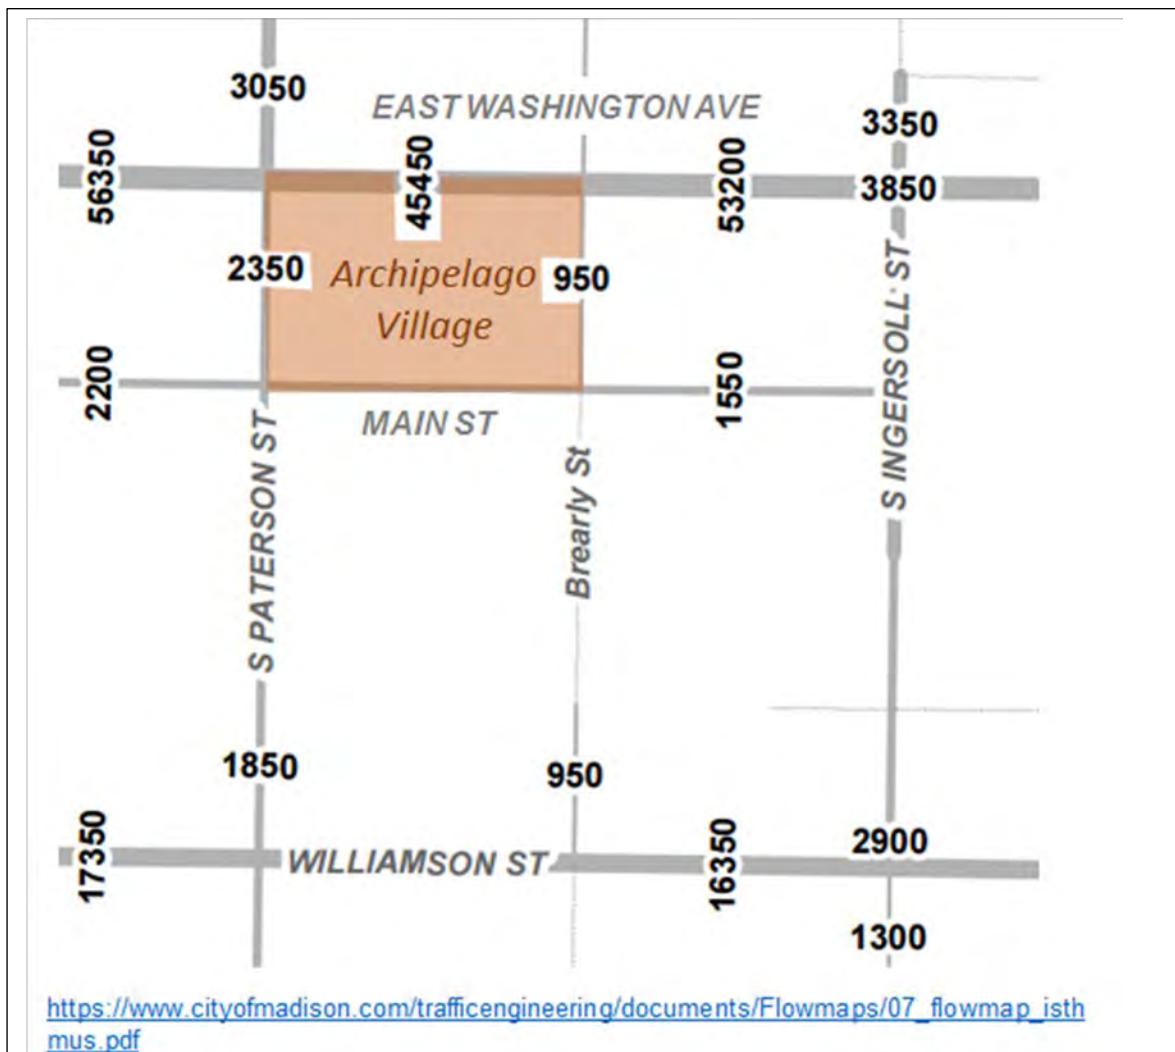

Figure 2.01-1 City of Madison Average Weekday Traffic Volume (2013)

## 2.02 INTERSECTION TURNING MOVEMENTS

The morning and evening rush hours are the controlling peak hours for the roadways surrounding the development. The Study Team performed peak period turning-movement counts for some of the study area intersections on March 16 and March 22, 2017, and used previously collected counts provided by the City at some intersections. The hours counted by the Study Team were from 6:30 to 8:30 A.M. and from 4 to 6 P.M. The highest morning peak hour occurred from 7:30 to 8:30 A.M. The highest evening

peak hour occurred from 4:30 to 5:30 P.M. The existing (2017) peak-hour traffic volumes then were balanced and are shown in Figure 2.02-1. Appendix B includes the raw AM and PM peak-hour traffic volumes.

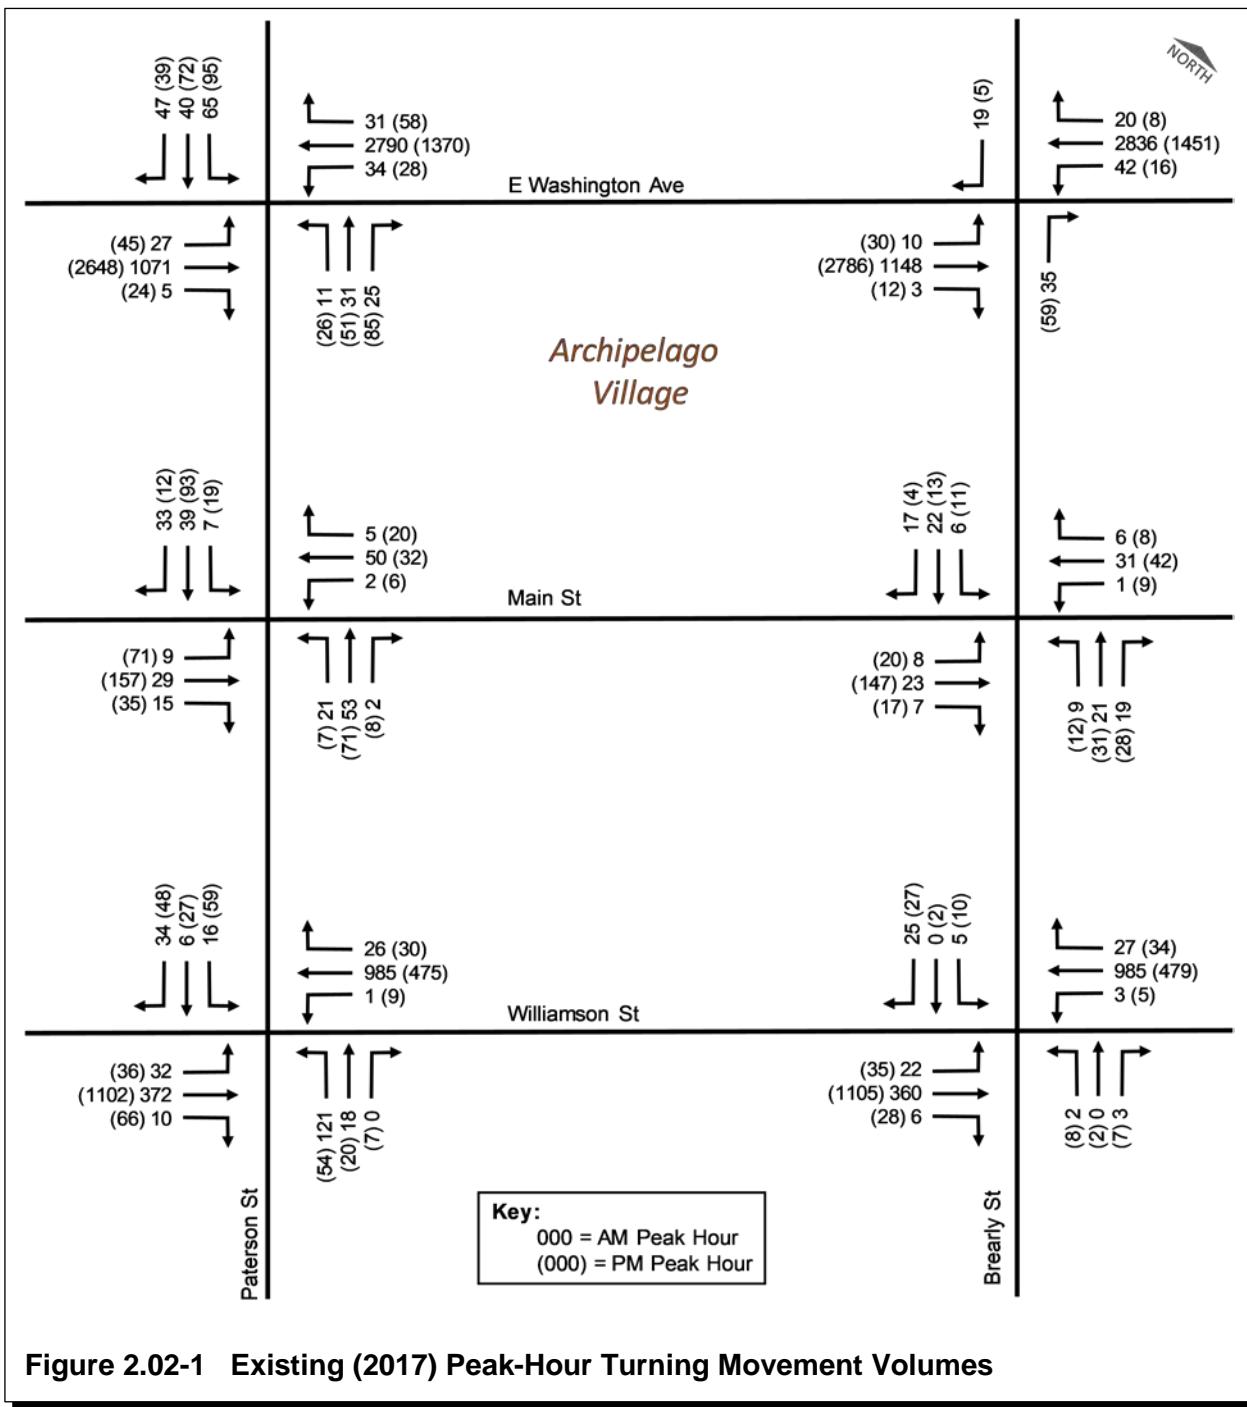

Figure 2.02-1 Existing (2017) Peak-Hour Turning Movement Volumes

## 2.03 PEDESTRIANS AND BICYCLES

Pedestrians and bikes were also counted during the same peak hours as the motor vehicles on March 16 and March 22, 2017. The highest pedestrian and bike crossing locations were at the intersections of Williamson Street and Paterson Street and East Washington Avenue and Paterson Street during the PM peak hour. Figure 2.03-1 shows the number of pedestrians and bikes during peak hours at each intersection crossing. It is likely these volumes would be greater during the summer months.

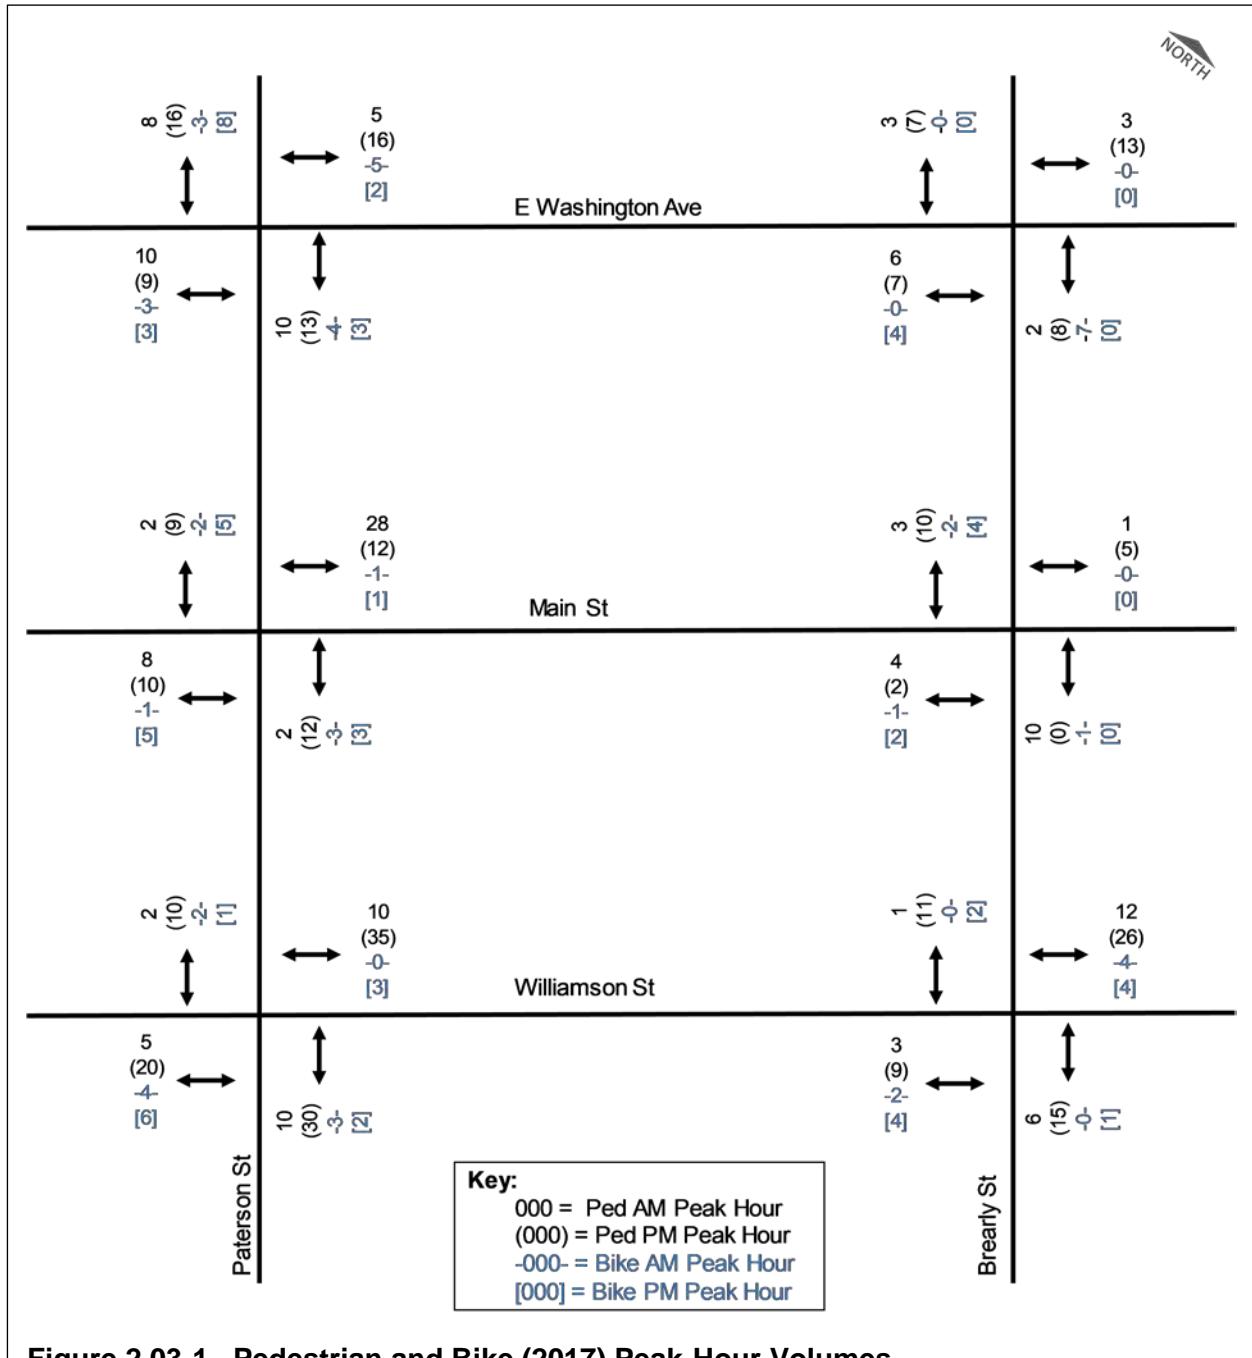

Figure 2.03-1 Pedestrian and Bike (2017) Peak-Hour Volumes

## 2.04 TYPICAL CITY DEVELOPMENT TRIP GENERATION RATES

The ITE Trip Generation Manual compiles trip generation rates for different land uses across North America. The land use samples have different contexts (urban, suburban, and rural), and size characteristics which may not accurately reflect trip generation rates for City development. The study performed traffic counts on the newly completed Constellation Development (Constellation) driveways during the morning and evening peak hours to understand the trip generation characteristics of development in Madison. Then the study compared these rates with the trip generation rates contained in the ITE Trip Generation Manual, 10th Edition.

Table 2.04-1 shows the trip generation comparison for the Constellation. Based on this comparison, near east side development was generating between 25 and 30 percent of the trips predicted by the ITE Trip Generation Manual. Possible reasons for this lower generation rate could include greater numbers of residents and patrons using alternate modes (walking, biking, and transit), staggered work hours, mixed uses, and lower overall trip generation rates across all modes. Appendix C includes the ITE Trip Generation for Constellation.

ITE Landuse for Constellation	Given Units	Unit	Daily Rate	Daily Trips	AM Peak Hour		PM Peak Hour	
					Hour Rate	Trips	Hour Rate	Trips
Apartment	218	Dwelling	6.65	1450	0.51	112	0.62	136
High-Turnover (Sit-Down) Restaurant	15.0	1000 GSF	127.15	1908	10.81	—	9.85	148
Drinking Place	3.5	1000 GSF	15.49	55	--	--	11.34	40
Coffee/Donut Shop with Drive-Through Window	3.5	1000 GSF	818.58	2866	100.58	353	42.8	150
Medical-Dental Office Building	3.5	1000 GSF	36.13	127	2.39	9	3.57	13
General Office Building <sup>1</sup>	7.0	1000 GSF	11.03	78	1.56	11	1.49	11

1 - Includes financial, and software engineering offices.

Calculated ITE Trip Gen Manual Development Trips for Constellation:	<b>6,484</b>	<b>485</b>	<b>498</b>
Observed Trip Generation from Constellation:	<b>142</b>	<b>123</b>	
Observed as a Percentage of Calculated:		<b>29%</b>	<b>25%</b>

Table 2.04-1 Observed vs Calculated Trip Generation for Constellation

---

**SECTION 3**  
**TRIP GENERATION AND ASSIGNMENT**

---

### 3.01 SITE DESCRIPTION

The proposed Archipelago Village includes residential units, mixed commercial use, a hotel, and general office space. The Development Team provided the following proposed uses, sizes in sf , and number of units (depending on their purpose) for full build-out of the site.

1. Residential Units–152 dwelling units
2. Mixed Commercial–68,000 sf
3. Hotel–144 units
4. Office Space–374,000 sf

Access to the site is planned for each of the four streets surrounding it: North Access (right-in/right-out only) on East Washington Avenue; East Access on Bearly Street; South Access on Main Street; and West Access on Paterson Street.

### 3.02 TRIP GENERATION

The Study Team generated trips for the proposed redevelopment site using the *ITE Trip Generation Manual*, 10th Edition. The ITE Manual provides several factors to estimate the traffic of a particular land use. For this analysis, the trips generated by the mixed commercial use and office building were determined using their building size in square feet, and the trips generated by the residential units and hotel were determined using the number of dwelling units and number of rooms, respectively. The breakdown of the 68,000 sf of commercial land uses is a best estimate at the time of this report. Two restaurant uses were assumed totaling 15,000 sf. The remaining 53,000 sf of commercial space was assumed to be one-half general retail/shopping (26,500 sf) and one-half clinic/medical uses (26,500 sf).

As mentioned in the development comparison in Section 2.04, motor vehicle trip generation characteristics of recent development on East Washington Avenue appear to be up to 70 percent lower than those predicted by the ITE Trip Generation Manual. Discussions with City Traffic Engineering in April 2017 resulted in an agreement to use a 30 percent reduction to ITE Trip Generation rates. Reasons for this more modest trip rate reduction included Archipelago Village having a higher proportion of office uses that have more predictable trip patterns. The 30 percent trip reduction accounts for lower trip generation rates, pass-by trips that are already on the street network, and the use of alternate modes.

Table 3.02-1 lists the land use assumptions used to develop the trip generation for Archipelago Village. These uses are meant to be a reasonable representation of the space use listed in Section 3.01-1. Actual and more descriptive uses will be determined as the development is approved and tenants are enlisted.

Using these stated base assumptions, the total number of daily new personal motor vehicle trips created by the proposed site is 6,252 trips. Of the total daily new trips, 506 would occur during the

AM peak hour, and 622 would occur during the PM peak hour as shown in Table 3.02-1. Appendix D includes the trip generation for the proposed redevelopment.

ITE Land Use	ITE Land Use Code	Daily Trips	AM Peak-Hour Trips			PM Peak-Hour Trips		
			AM In	AM Out	Trips	PM In	PM Out	Trips
High-Turnover (Sit-Down) Restaurant	932	561	28	22	50	30	19	49
Quality Restaurant	931	834	--	--	--	52	26	78
Shopping Mall	820	1001	16	9	25	48	53	101
General Office Building	710	3643	373	61	434	69	362	431
Clinic	630	1012	76	22	98	25	62	87
Hotel	310	1204	40	28	68	44	43	87
Multifamily Housing (High Rise)	222	677	12	36	48	34	21	55
<b>Total Trips:</b>		<b>8,932</b>	<b>545</b>	<b>178</b>	<b>723</b>	<b>302</b>	<b>586</b>	<b>888</b>
30% Reduction		(2,680)	(164)	(53)	(217)	(91)	(176)	(266)
<b>Total New Development Trips:</b>		<b>6,252</b>	<b>382</b>	<b>125</b>	<b>506</b>	<b>211</b>	<b>410</b>	<b>622</b>

**Table 3.02-1 Development Trip Generation Summary**

### 3.03 TRIP DISTRIBUTION AND ASSIGNMENT

The Study Team distributed the trips generated by Archipelago Village to the roadway network based on existing peak-hour turning movements of the study intersections. A percentage of the total new trips was assigned to each direction of travel during the AM and PM peak hours. Figure 3.03-1 shows the assigned percentages. It should be noted that in the PM peak hour, eastbound Main Street captures much of the traffic leaving the study area. This traffic is likely destined for the signalized East Washington Avenue and Ingersoll Street intersection.

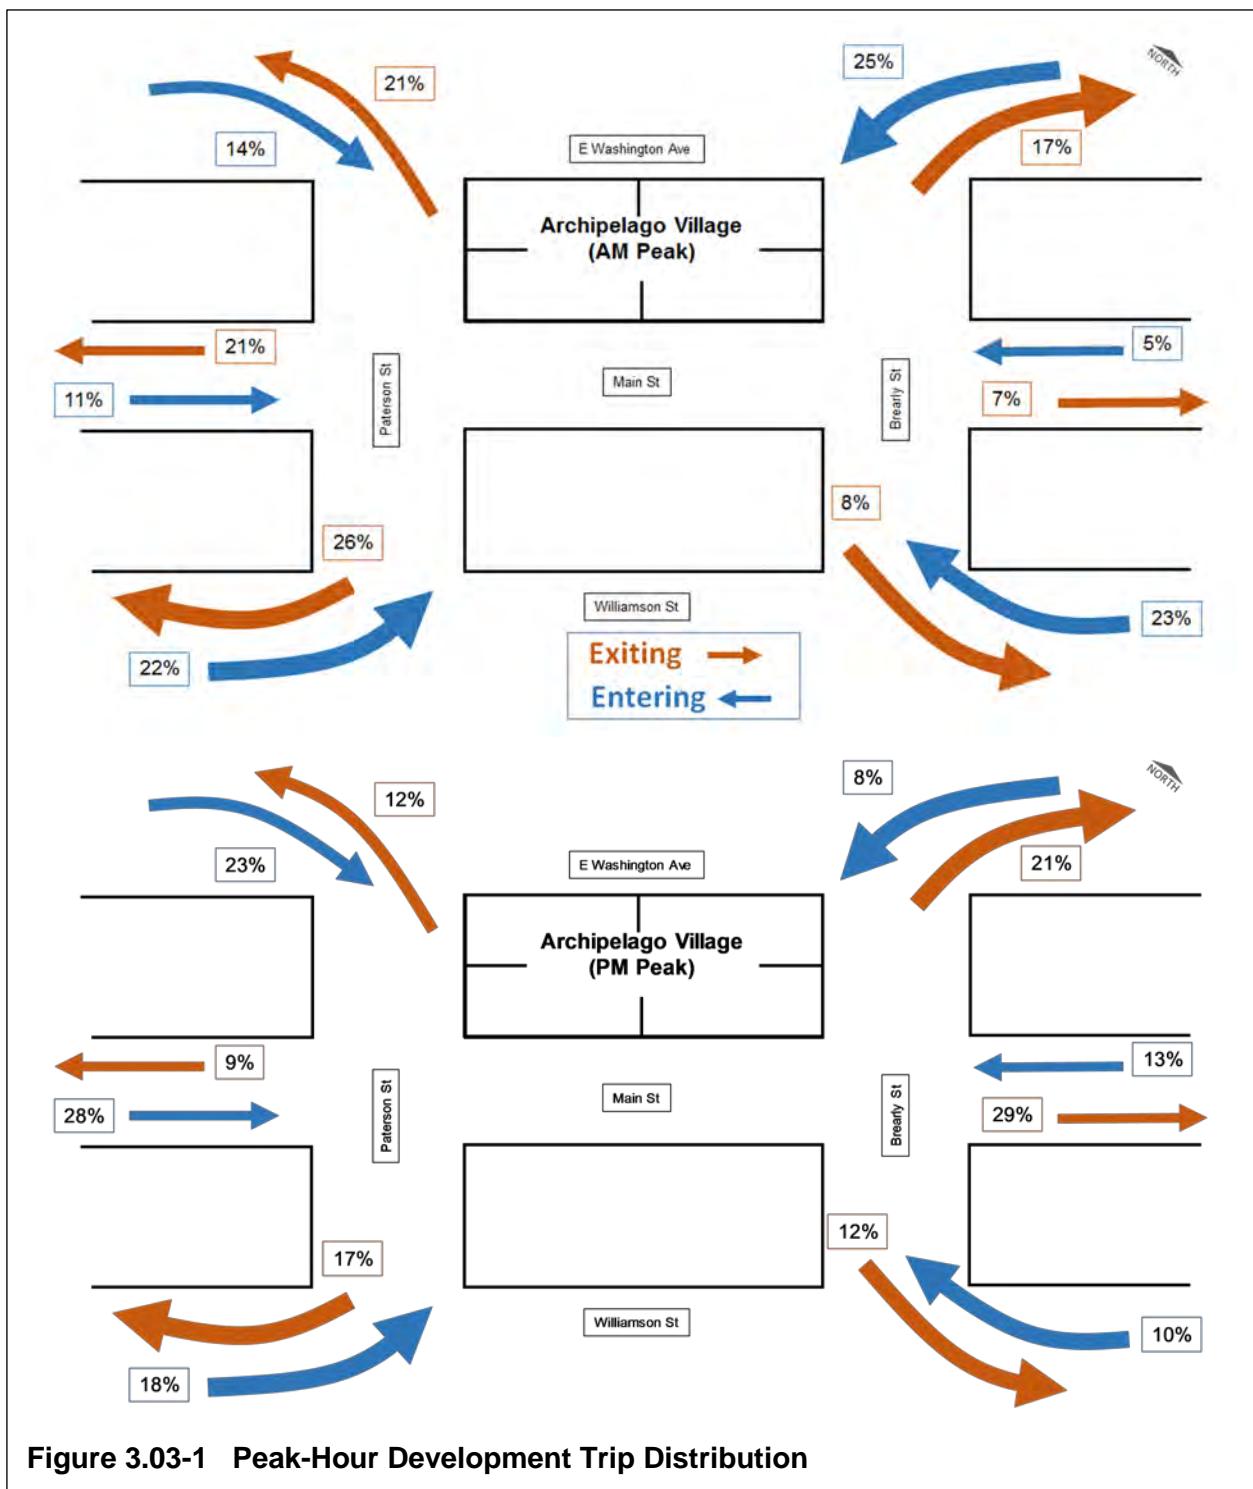

Figure 3.03-1 Peak-Hour Development Trip Distribution

---

**SECTION 4**  
**2017 EXISTING CONDITIONS**

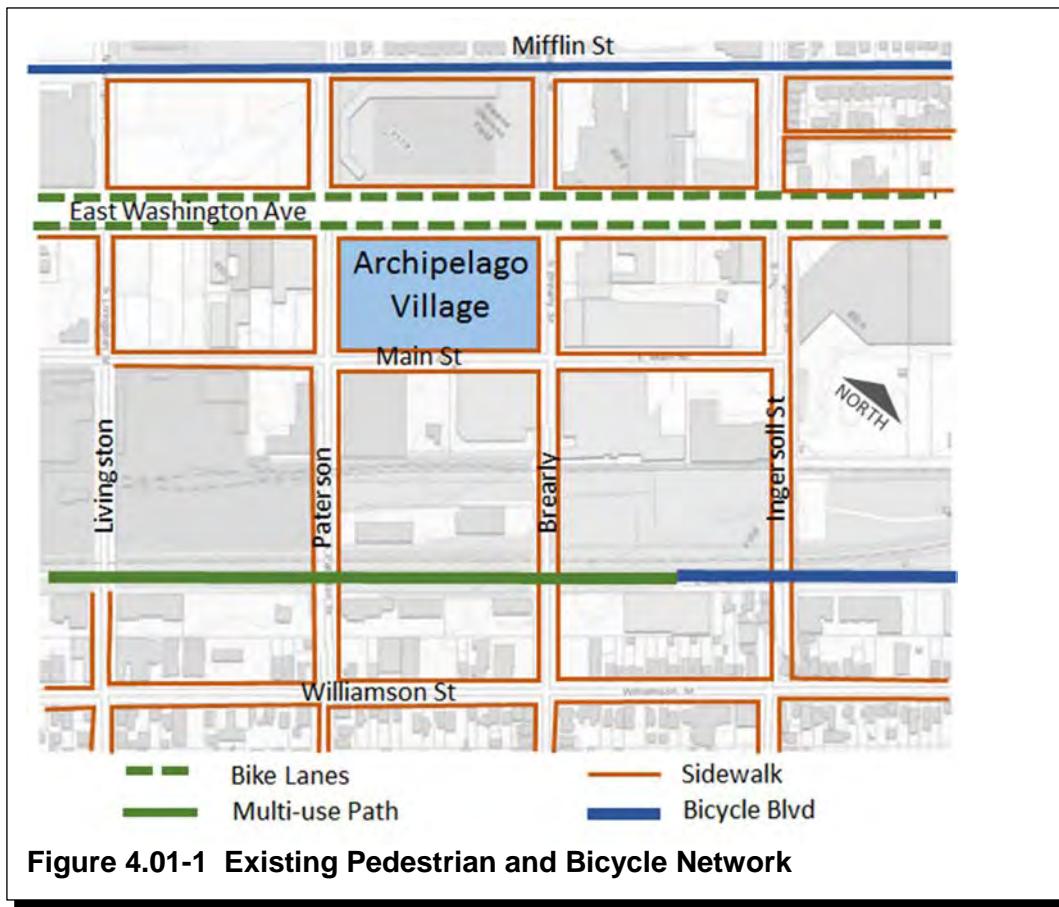

#### 4.01 PEDESTRIANS AND BICYCLES

Pedestrians have access to the site via East Washington Avenue, Bearly Street, Main Street, Paterson Street, and Williamson Street. Sidewalk is continuous on all of these streets on both sides. All study intersections have traditionally marked crosswalks. Pedestrian signal heads exist at all the signalized study intersections: East Washington Avenue and Paterson Street; East Washington Avenue and Ingersoll Street; and Williamson Street and Paterson Street.

Cyclists have access to the site via the streets and paths that surround it. The following bullets summarize the bicycle accommodations to and from the site.

- East Washington Avenue—On-street bike lanes in both directions.
- Paterson Street—Low volume road, no bike lanes.
- Bearly Street—Low volume road, no bike lanes.
- Capital City Trail—Regional bike path two blocks south of Archipelago Village.
- Williamson Street—Higher volume road without marked bike lanes. Parking is allowed in the off-peak direction, which also provides a widened outside lane that some cyclists feel comfortable using.

Figure 4.01-1 illustrates the existing pedestrian and bicycle facilities adjacent to the proposed Archipelago Village.

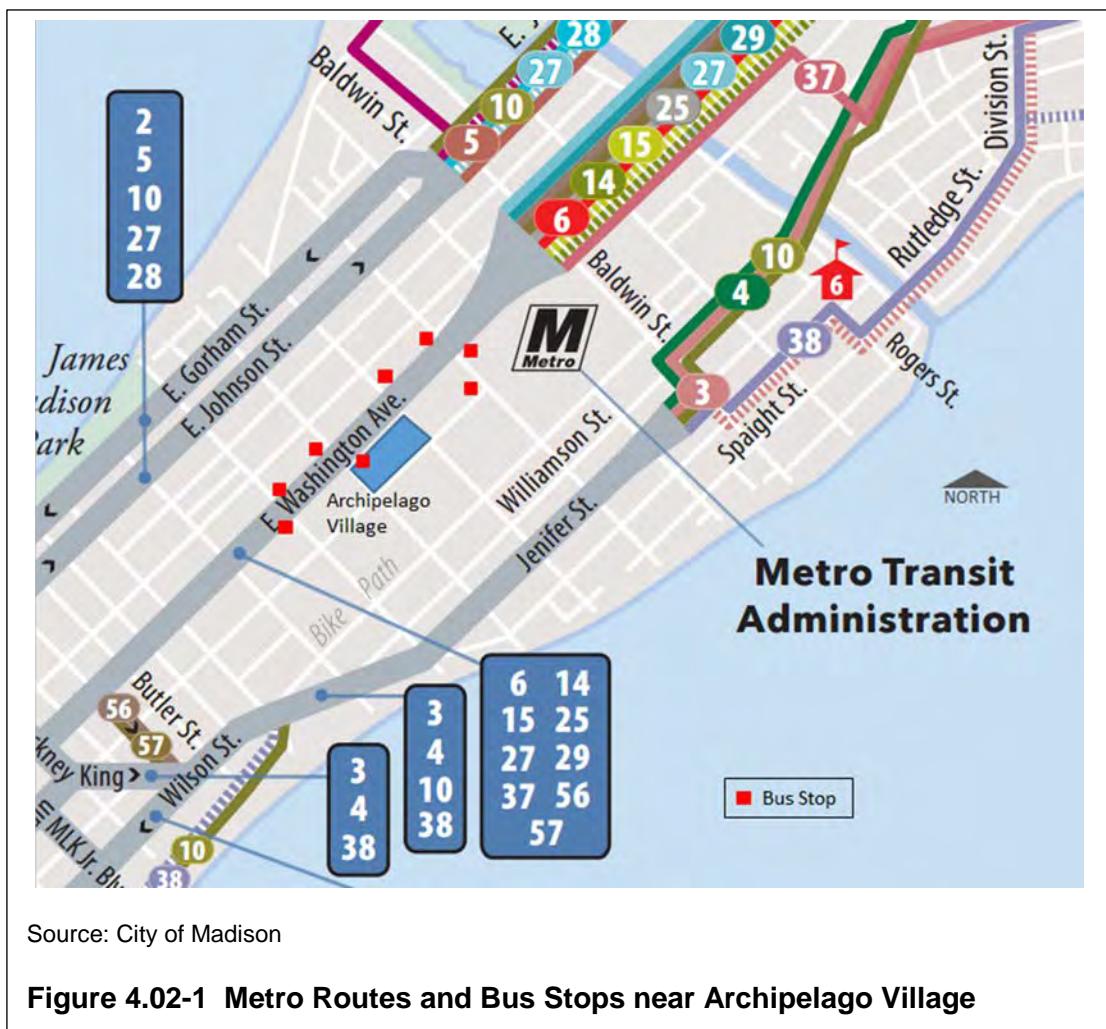

## 4.02 TRANSIT

There are nine bus routes that use and serve East Washington Avenue: one is in service all day, and eight are in service during the peak hours from 6 to 9 A.M. and 3 to 7 P.M.

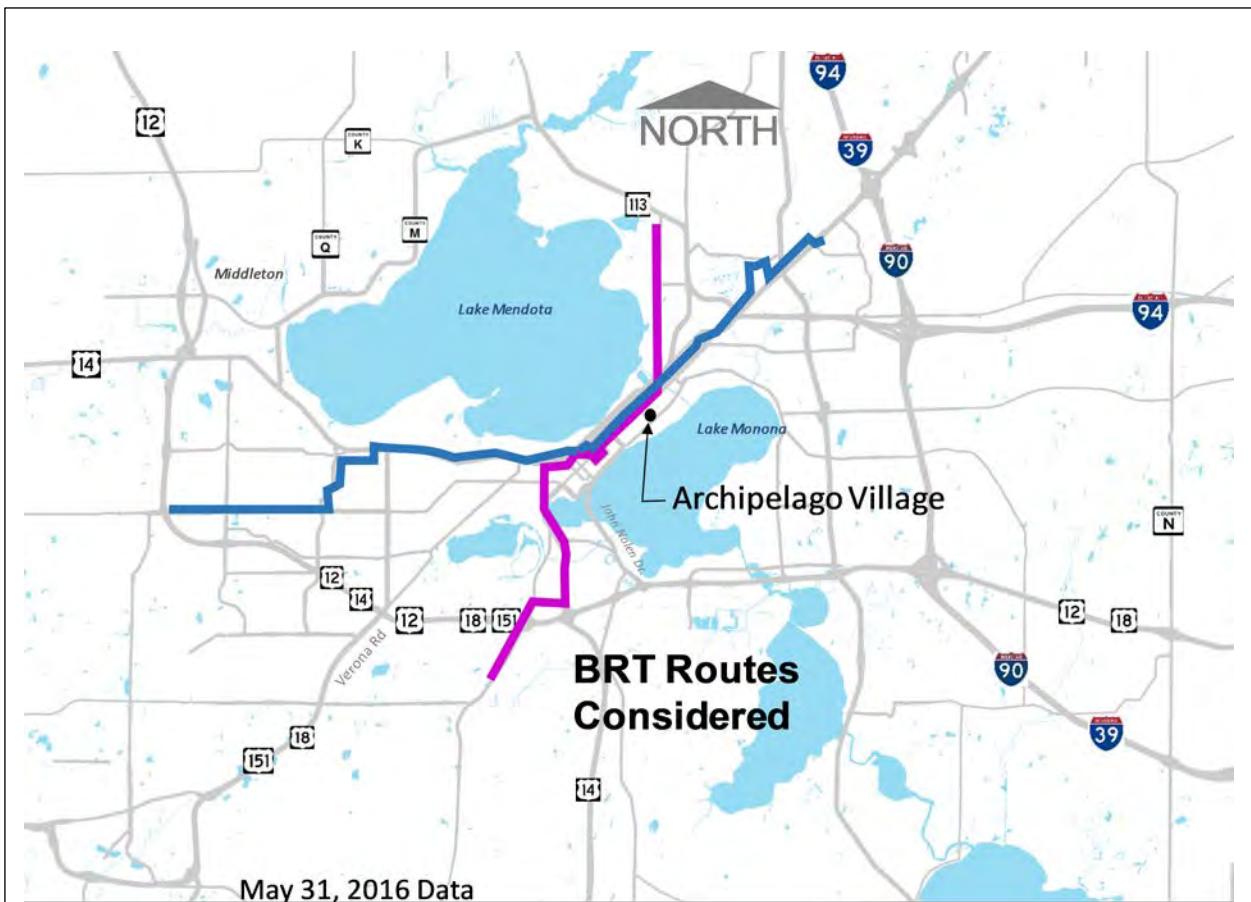

There are five bus stops at the study intersections:

- Two at the East Washington Avenue and Paterson Street intersection.
- One at the East Washington Avenue and Bearly Street intersection.
- Two at the East Washington Avenue and Ingersoll Street intersection.

Figure 4.02-1 shows bus routes and bus stops near the proposed development.

In addition to existing transit service, East Washington Avenue is one of four proposed routes for the City's Bus Rapid Transit (BRT) initiative. Implementation of BRT is currently being studied. Initial implementation is currently anticipated to include the east-west BRT routes that include this portion of East Washington Avenue. When implemented, BRT will provide a very high service level from and to Archipelago Village. Figure 4.02-2 illustrates the current BRT routes being considered.

Source: City of Madison

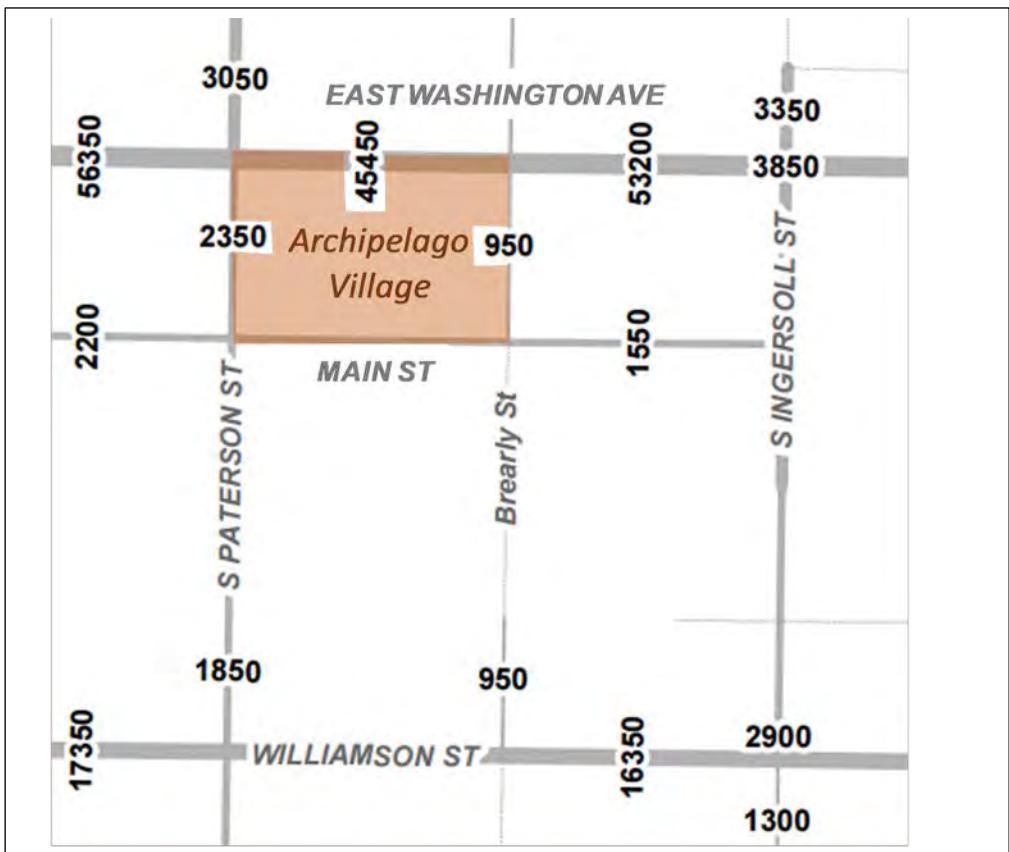

**Table 4.02-2 Planned BRT Routes**

#### 4.03 MOTOR VEHICLES

##### A. Traffic Volumes

East Washington Avenue is a primary arterial in the City's roadway functional classification system. It is one of two primary arterials that link east and northeast Madison, Sun Prairie, and I-39/90/94 to the downtown. According to the City's traffic count data, the average weekday traffic (AWT) count on East Washington Avenue in the vicinity of Archipelago Village is about 45,000 vehicles per day (vpd). The AWT count on Bearly Street is about 1,100 vpd; the AWT count on Main Street is about 2,200 vpd, and is about 2,050 vpd on Paterson Street.

Williamson Street serves as a link between the Atwood Avenue neighborhoods and the west and south sides of the City. Williamson Street carries about 17,000 vehicles on an average weekday. During the AM peak hours, on-street parking is restricted in the westbound direction. During the PM peak hours parking is restricted in the eastbound direction. Figure 4.03-1 shows the 2013 AWT counts near the site.

**Figure 4.03-1 Average Weekday Traffic Volumes (2013)**

## B. Traffic Operations–2017 Existing Conditions Without Development

Study intersection operations were analyzed using Synchro 10 software. Synchro is a macroscopic (equation based) program that uses the processes outlined in the Highway Capacity Manual (HCM) developed by the Federal Highway Administration (FHWA). The HCM 6 results are documented in this report. HCM 2000 was occasionally used where non-NEMA phasing was implemented. The Study Team also used SimTraffic software, which is microscopic (simulates individual vehicles on the street network), to observe traffic flow and queuing during the peak hours.

The Study Team evaluated operations based on existing conditions at seven intersections surrounding the site. The operations analysis for most intersections was on turning movement volumes taken in spring 2017. An intersection's LOS is based on average delay in seconds per vehicle for traffic entering the intersection. LOS A indicates minimal average delay at an intersection (less than 10 seconds) while LOS F indicates a higher delay (more than 50 seconds at an unsignalized intersection and 80 seconds at a signalized intersection). For unsignalized intersections, the LOS of the poorest yielding movement is

reported as the intersection LOS. This is because there could be a high volume on a non-yielding movement skewing the overall average delay even if a lower volume yielding movement is failing. Table 4.03-1 shows the delay thresholds for LOS at signalized and unsignalized intersections.

LOS	Signalized Intersections (average delay, seconds)	Unsignalized Intersections (average delay, seconds)
A	<10	<10
B	10 to 20	10 to 15
C	>20 to 35	>15 to 25
D	>35 to 55	>25 to 35
E	>55 to 80	>35 to 50
F	>80	>50

**Table 4.03-1 LOS Thresholds**

Table 4.03-2 is a summary of the 2017 Existing Conditions operations modeling results. The modeling reports are provided in Appendix E. Summary tables of all the modeling scenarios are included in Appendix I.

Location	Existing Conditions (2017) Intersection Operations					
	AM Peak Hour			PM Peak Hour		
	Overall LOS	LOS E Movement (s)	LOS F Movement (s)	Overall LOS	LOS E Movement (s)	LOS F Movement (s)
E Washington Avenue and Paterson Street (Signalized)	A	--	--	B	--	--
E Washington Avenue and Bearly Street (Unsignalized)	F	--	EBL, SBR	F	--	NBR, WBL
E Washington Avenue and Ingersoll Street (Signalized)	A	--	--	A	--	--
Main Street and Paterson Street (Unsignalized)	A	--	--	A	--	--
Main Street and Bearly Street (Unsignalized)	A	--	--	A	--	--
Williamson Street and Paterson Street (Signalized)	A	--	--	A	--	--
Williamson Street and Bearly Street (Unsignalized)	C	--	--	F	--	NBL/T/R

**Table 4.03-2 2017 Existing Conditions Intersection Operations**

1. AM Peak Hour Operations—Existing Conditions

a. East Washington Avenue and Livingston Street

Field observations made during traffic movement counts indicate that the westbound left-turn queues at the Livingston Street intersection extend out of the existing storage bay during the AM peak hours. This queuing reached the East Washington Avenue and Paterson Street intersection, increasing East Washington travel delays.

b. East Washington Avenue and Paterson Street.

The signalized intersection of East Washington Avenue and Paterson Street operates at LOS A with a maximum volume to capacity (V/C) ratio of 0.77. The westbound through movements operate at LOS A with 95th and 50th percentile queues of approximately 355 feet and 230 feet, respectively. The 95th percentile queues represent the length exceeded during 5 percent of the weekday peak hours. The 50th percentile queues represent average peak hour conditions, so queues will sometimes be shorter and sometimes be longer. The Bearly Street intersection is located about 540 feet east of the East Washington Avenue and Paterson Street intersection, so the longest through queues in the westbound direction do not block the Bearly Street intersection (based on HCM 6 results).

c. East Washington Avenue and Bearly Street

The side-street stop-controlled intersection of East Washington Avenue and Bearly Street operates at LOS F with a maximum V/C ratio of 0.36. The eastbound left-turn and southbound right-turn movements operate at LOS F with 95th percentile queues of less than 50 feet (two vehicles or less).

d. East Washington Avenue and Ingersoll Street

The signalized intersection of East Washington Avenue and Ingersoll Street operates at LOS A with a maximum V/C ratio of 0.75. The westbound through movements operate at LOS A with 95th and 50th percentile queues of approximately 290 feet and 180 feet, respectively. Few Street is located about 575 feet east of Ingersoll Street on East Washington Avenue, so the longest through queues in the westbound direction do not block the Few Street intersection based on HCM 6 results.

e. Main Street and Paterson Street

The all-way stop-controlled intersection of Main Street and Paterson Street operates at LOS A with a maximum V/C ratio of 0.11. All of the movements have 95th percentile queues of 25 feet or less.

f. Main Street and Bearly Street

The all-way stop controlled intersection of Main Street and Bearly Street operates at LOS A with a maximum V/C ratio of 0.07. All the movements have 95th percentile queues of 25 feet or less.

g. Williamson Street and Paterson Street

The signalized intersection of Williamson Street and Paterson Street operates at LOS A with a maximum V/C ratio of 0.58. The westbound traffic has a 95th percentile queues of about 170 feet.

h. Williamson Street and Bearly Street

The side-street stop-controlled intersection of Williamson Street and Bearly Street operates at LOS C with a maximum V/C ratio of 0.14. All of the movements have 95th percentile queues of 25 feet or less.

2. PM Peak Hour Operations—Existing Conditions

a. East Washington Avenue and Paterson Street.

The signalized East Washington Avenue and Paterson Street intersection operates at LOS B with a maximum V/C ratio of 0.74. The eastbound through movements operate at LOS A with 95th and 50th percentile queues of approximately 355 feet and 245 feet, respectively. The Livingston Street intersection is located about 550 feet west of the East Washington Avenue and Paterson Street intersection, so the eastbound longest through queues do not block the Livingston Street intersection based on HCM 6 results.

b. East Washington Avenue and Bearly Street

The unsignalized East Washington Avenue and Bearly Street intersection operates at LOS F with a maximum V/C ratio of 0.57. The northbound right-turn and westbound left-turn movements operate at LOS F with 95th percentile queues of less than 75 feet (three vehicles or less). SimTraffic microsimulation model observations indicate queues of similar lengths.

c. East Washington Avenue and Ingersoll Street

The signalized East Washington Avenue and Ingersoll Street intersection operates at LOS A with a maximum V/C ratio of 0.85. All movements operate at LOS D or better with 95th percentile queues of 180 feet or less. These queues are not expected to block adjacent intersections.

d. Main Street and Paterson Street

The all-way stop-controlled Main Street and Paterson Street intersection operates at LOS A with a maximum V/C ratio of 0.36. All the movements have 95th percentile queues of 40 feet or less.

e. Main Street and Bearly Street

The all-way stop-controlled Main Street and Bearly Street intersection operates at LOS A with a maximum V/C ratio of 0.26. All the movements have 95th percentile queues of 30 feet or less.

f. Williamson Street and Paterson Street

The signalized Williamson Street and Paterson Street intersection operates at LOS A with a maximum V/C ratio of 0.55. The eastbound movements have 95th percentile queues of approximately 205 feet. SimTraffic microsimulation model observations indicate that all the queues generally clear during each signal cycle.

g. Williamson Street and Bearly Street

The side-street stop-controlled Williamson Street and Bearly Street intersection operates at LOS F with a maximum V/C ratio of 0.22. The northbound movements operate at LOS F with 95th percentiles queues of 25 feet or less without the proposed site traffic. SimTraffic microsimulation observations show similar queueing results.

**SECTION 5**  
**2037 EXISTING GEOMETRY WITHOUT DEVELOPMENT**

---

## 5.01 PEDESTRIANS AND BICYCLES

The 2037 Existing Geometry Without Development Alternative would not make any improvements to pedestrian or bike accommodations. Pedestrians and cyclists would continue to use the existing sidewalks and bike lanes. Because of the existing bike lanes on East Washington Avenue and the adjacent Capital City trail, this location has relatively high levels of connections for nonmotorized transportation modes.

## 5.02 TRANSIT

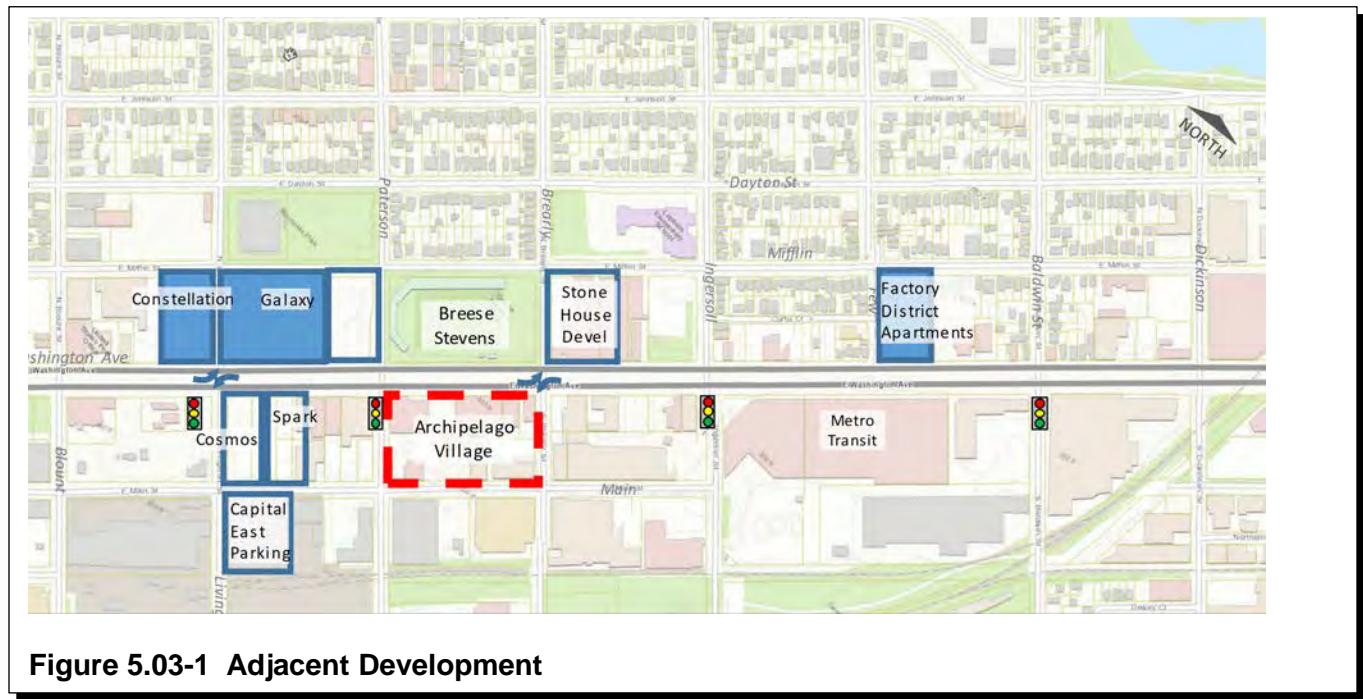

Because the site is adjacent to East Washington Avenue, it would maintain relatively high transit service levels with or without the development.

Without development, this site would not have the higher density/trip-making potential that would help support future BRT implementation.

## 5.03 MOTOR VEHICLES

### A. Traffic Volumes

The East Washington Avenue corridor is experiencing high levels of redevelopment. Figure 5.03-1 illustrates the developments that are under way or have been recently completed during the preparation of this traffic impact analysis; yet their full trip-making potential has not yet been experienced. When analyzing future traffic operations, it is important to account for trips generated from adjacent development.

The Madison Area Transportation Planning Board maintains a travel demand model. This model is federally funded and mandated for Metropolitan Planning Organizations (MPOs). The travel demand model uses the transportation network and predicts traffic volumes based on population, land use, households, employment, trip rates, travel costs, and other data. The model is calibrated to the base year—typically a census year. Then population, land use, household, and employment data is modified to reflect future, or horizon year, plans and conditions. With these modifications, the demand model provides traffic volume projections that acknowledge the planned changes in land use, including redevelopment.

Figure 5.03-2 illustrates the traffic analysis zones (TAZs) in the travel demand model for the East Washington Avenue corridor.

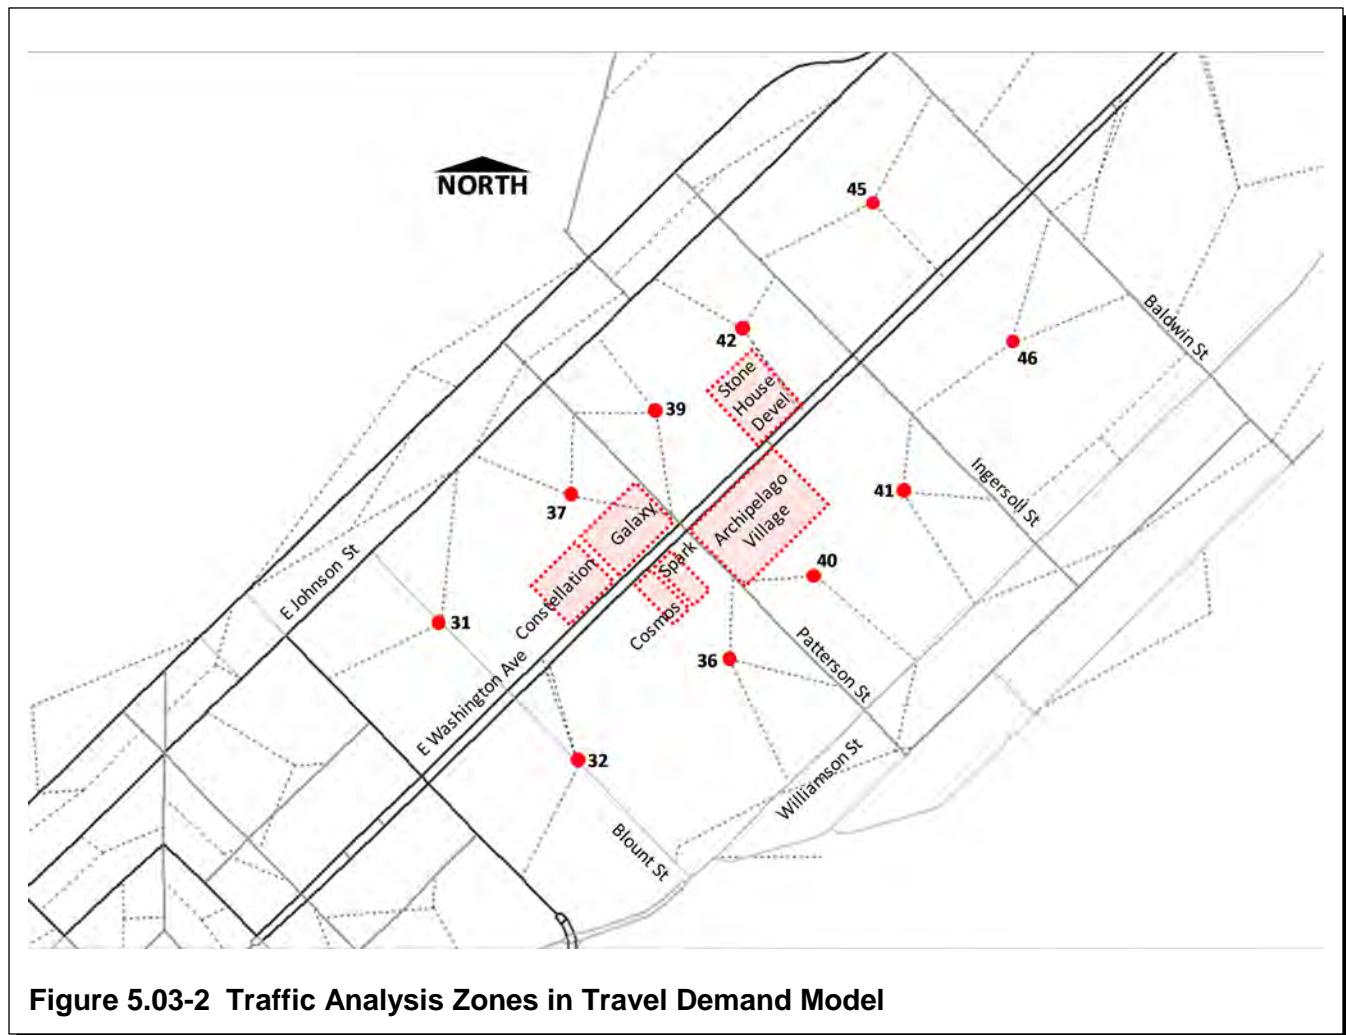

Table 5.03-1 shows the projected population, household, and employment growth for the year 2050 as contained in the travel demand model. TAZ 40 contains Archipelago Village and is highlighted. All zones in the vicinity show greater densities of population, households, and employment. Discussions with Madison Traffic Engineering indicated that these TAZ growth projections reasonably represent the background traffic growth resulting from redevelopment along the East Washington Avenue corridor.

Consequently, projected traffic growth predicted by the travel demand model provides a reasonable rate of background growth.

Traffic Analysis Zone	2010	2050	2010	2050	2010	2050	2010	2050
	Population	Population	Households	Households	Retail Employment	Retail Employment	Service Employment	Service Employment
31	648	1194	305	656	49	116	241	343
32	21	29	6	11	0	78	745	823
36	182	542	137	362	19	87	96	135
37	140	818	72	496	91	173	57	92
39	242	322	124	174	20	20	17	92
40 Archipelago Village	7	367	3	228	65	155	242	332
41	72	432	42	267	0	48	41	72
42	141	443	72	261	5	13	153	174
45	584	906	318	519	95	227	73	129
46	0	0	0	0	10	10	108	108
<b>Total</b>	<b>2037</b>	<b>5053</b>	<b>1079</b>	<b>2974</b>	<b>354</b>	<b>927</b>	<b>1773</b>	<b>2300</b>

Table 5.03-1 Travel Demand Model TAZ Parameters

The 2050 travel demand model assignments, when compared against the 2010 travel demand model assignments, grow at approximately 0.9 percent per year. The 2050 travel demand model assignments, when compared against the 2013 traffic volume counts, grow at approximately 0.5 percent per year.<sup>1</sup> The Study Team projected the Existing Geometry Without Development Alternative traffic volumes using a 0.70 percent increase per year to account for background traffic growth. This resulted in a 14 percent increase applied to 2017 turning-movement volumes to obtain 2037 turning-movement volumes at the seven study intersections.

Figure 5.03-3 illustrates the 2037 peak-hour turning movement volumes used for the Existing Geometry Without Development analysis.

<sup>1</sup> The 2013 traffic volume counts are higher than the 2010 demand model assignments, and, therefore, there is less growth between 2013 and 2050.

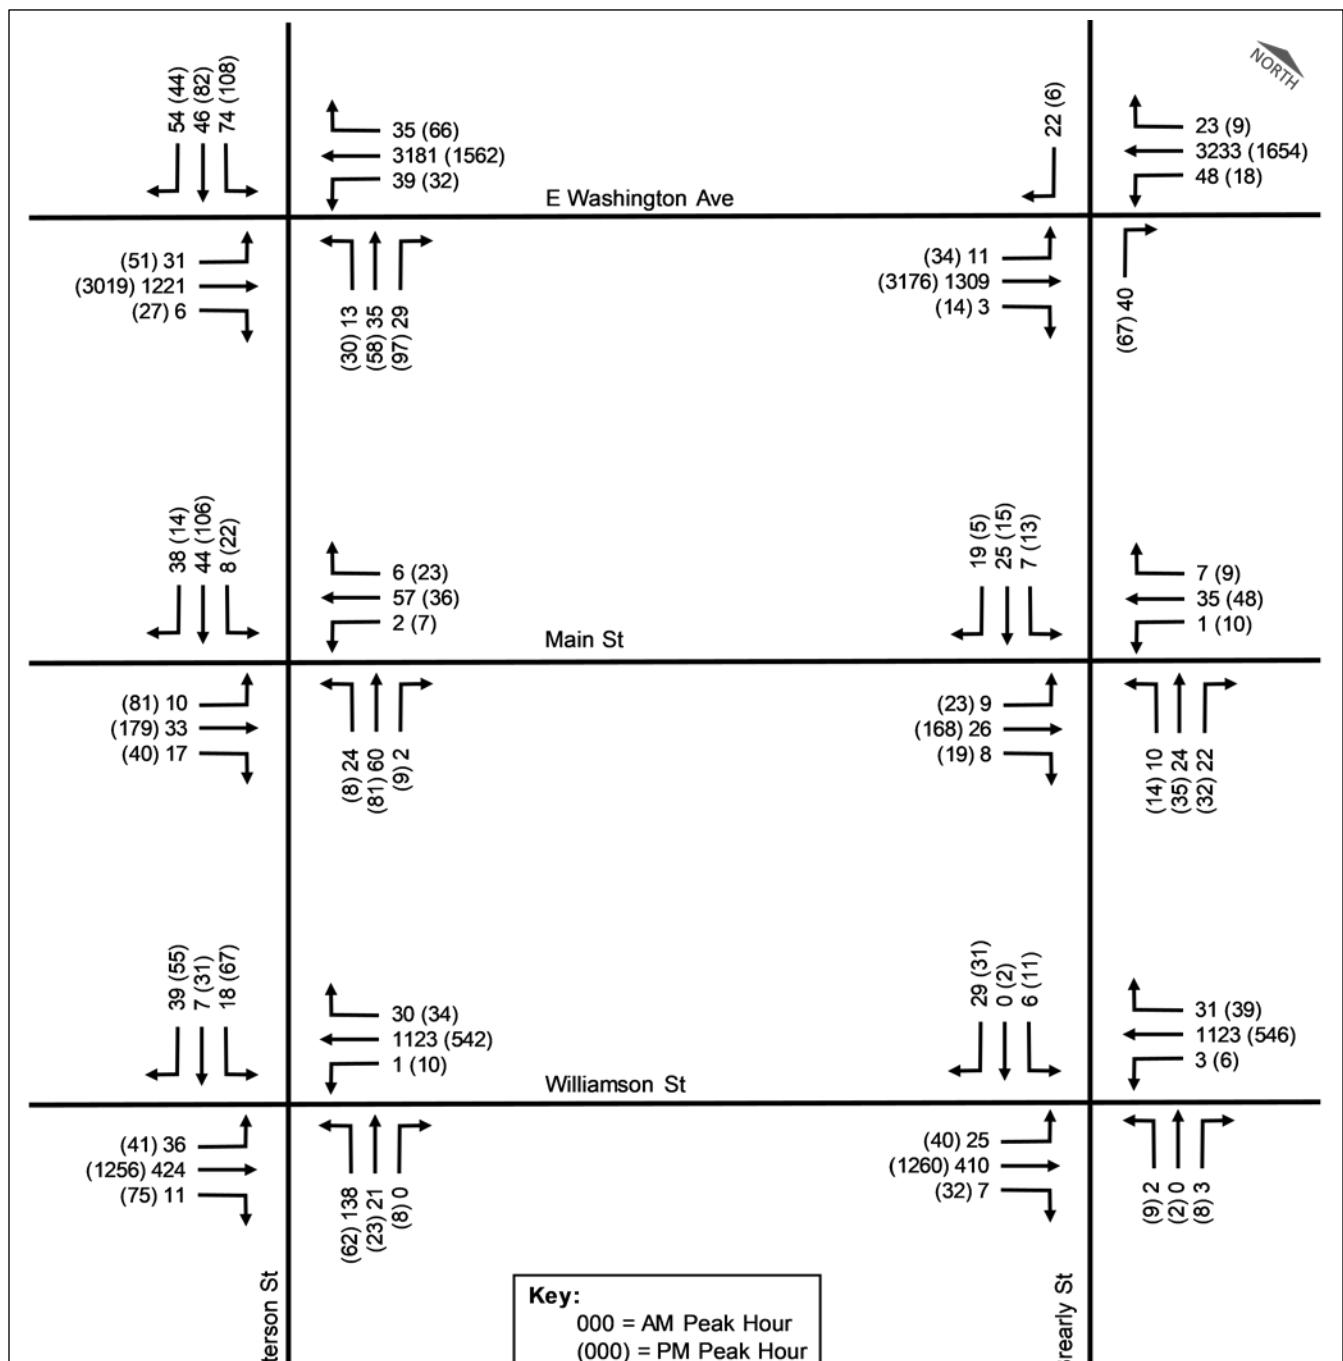

Figure 5.03-3 2037 Turning-Movement Volumes Without Development

B. Traffic Operations—2037 Existing Geometry Without Development

Table 5.03-2 summarizes the operations modeling results for the 2037 Existing Geometry morning and evening peak hours without the development. The modeling reports are provided in Appendix F. Summary tables of all the modeling scenarios are included in Appendix I.

Location	2037 Existing Geometry Intersection Operations					
	AM Peak Hour			PM Peak Hour		
	Overall LOS	LOS E Movement (s)	LOS F Movement (s)	Overall LOS	LOS E Movement (s)	LOS F Movement (s)

Notes:

EBL = eastbound left

**Table 5.03-2 2037 Existing Geometry Without Development Traffic Operations**

1. 2037 AM Peak Hour Operations—Without Development

a. East Washington Avenue and Paterson Street

The signalized East Washington Avenue and Paterson Street intersection will operate at LOS B with a maximum V/C ratio of 0.88. The westbound through movements will operate at LOS B with 95th and 50th percentile queues of approximately 485 feet and 335 feet, respectively. The 95th percentile queues represent the length expected to be exceeded during 5 percent of the weekday peak hours. The 50th percentile queues represent average peak-hour conditions, so queues will sometimes be shorter and sometimes be longer. The Bearly Street intersection is located about 540 feet east of the East Washington Avenue and Paterson Street intersection, so the longest through queues in the westbound direction would not block the Bearly Street intersection based on HCM 6 results. SimTraffic microsimulation model observations show longer westbound queues, reaching the Bearly Street intersection at times.

The eastbound left-turn movement deteriorates with background traffic growth and is projected to operate at LOS E with 95th percentile queues of approximately 50 feet.

SimTraffic microsimulation model observations indicate that this queueing would spill out of the existing 115-foot storage bay at times.

b. East Washington Avenue and Bearly Street

The side-street stop-controlled East Washington Avenue and Bearly Street intersection will operate at LOS F with a maximum V/C ratio of 0.66. The eastbound left-turn and southbound right-turn movements operate at LOS F with 95th percentile queues of less than 45 feet without the proposed site traffic. SimTraffic microsimulation observations indicate similar operational conditions.

c. East Washington Avenue and Ingersoll Street

The signalized East Washington Avenue and Ingersoll Street intersection will operate at LOS B with a maximum V/C ratio of 0.91. The westbound through movement is projected to operate at LOS B with 95th and 50th percentile queues of approximately 555 feet and 395 feet, respectively. The Few Street intersection is located about 575 feet east of the East Washington Avenue and Ingersoll Street intersection, so the westbound longest through queues may reach the Few Street intersection on rare occasions. The eastbound left-turn will operate at LOS D with 95th percentile queues of approximately 25 feet. SimTraffic microsimulation observations indicate that the westbound through queueing generally would clear during each signal cycle, and the eastbound left-turn queuing would be stored within the existing turn bay.

d. Main Street and Paterson Street

The all-way stop-controlled Main Street and Paterson Street intersection will operate at LOS A with a maximum V/C ratio of 0.12. All the movements have 95th percentile queues of 25 feet or less.

e. Main Street and Bearly Street

The all-way stop-controlled Main Street and Bearly Street intersection will operate at LOS A with a maximum V/C ratio 0.09. All of the movements would have 95th percentile queues of 25 feet or less.

f. Williamson Street and Paterson Street

The signalized Williamson Street and Paterson Street intersection operates at LOS B with a maximum V/C ratio of 0.66. The westbound movements would have 95th percentile queues of approximately 205 feet.

g. Williamson Street and Bearly Street

The side-street stop-controlled Williamson Street and Bearly Street intersection LOS deteriorates with the added background traffic and would operate at LOS D with a

maximum V/C ratio of 0.22. While the LOS deteriorates, all the movements would have 95th percentile queues of less than 25 feet. SimTraffic microsimulation observations indicate similar operations.

2. 2037 PM Peak Hour Operations—Without Development

a. East Washington Avenue and Paterson Street.

The signalized East Washington Avenue and Paterson Street intersection is projected to operate at LOS B with a maximum V/C ratio of 0.86. The eastbound through movements will operate at LOS B with 95th and 50th percentile queues of approximately 465 feet and 360 feet, respectively. The 95th and 50th percentile queues would not block the Livingston Street intersection (based on HCM 6 results). SimTraffic microsimulation model observations indicate that this queueing generally would clear during each signal cycle.

The westbound left-turn movement would deteriorate and operate at LOS D with 95th percentile queues of approximately 40 feet. SimTraffic microsimulation observations indicate that this queuing extends beyond the existing 150-foot storage bay without the proposed site traffic.

b. East Washington Avenue and Bearly Street

The side-street stop controlled East Washington Avenue and Bearly Street intersection will operate at LOS F with a maximum V/C ratio of 0.90 without the proposed site traffic. The northbound right-turn movement would operate at LOS F with 95th percentile queues of approximately 115 feet. The westbound left-turn movement operates at LOS F with 95th percentile queues of approximately 55 feet. SimTraffic microsimulation observations indicate similar queueing results.

c. East Washington Avenue and Ingersoll Street

The signalized East Washington Avenue and Ingersoll Street intersection would operate at LOS B with a maximum V/C ratio of 0.98. All movements operate at LOS D or better with 95th percentile queues of 215 feet or less. These queues are not expected to block adjacent intersections. SimTraffic observations indicate the northbound right-turn queuing spills out of the existing turn-bay.

d. Main Street and Paterson Street

The all-way stop-controlled Main Street and Paterson Street intersection will operate at LOS A with a maximum V/C ratio of 0.42. All the movements have 95th percentile queues of 50 feet or less.

e. Main Street and Bearly Street

The all-way stop-controlled Main Street and Bearly Street intersection will operate at LOS A with a maximum V/C ratio 0.30. All the movements have 95th percentile queues of 35 feet or less.

f. Williamson Street and Paterson Street

The signalized Williamson Street and Paterson Street intersection will operate at LOS B with a maximum V/C ratio of 0.64. The westbound movements are projected to operate at LOS A with 95th percentile queues of 205 feet. SimTraffic microsimulation model observations indicate that the westbound to southbound left-turn movement causes some queues because of the restricted single shared lane on westbound Williamson Street during the PM peak hours, but this queueing would not reach the Bearly Street intersection.

g. Williamson Street and Bearly Street

The side-street stop-controlled Williamson Street and Bearly Street intersection will operate at LOS F with a maximum V/C ratio of 0.39. The northbound movements operate at LOS F with 95th percentile queues of approximately 35 feet. SimTraffic microsimulation model observations indicate the northbound queues are less than two vehicles.

**SECTION 6**  
**2037 EXISTING GEOMETRY WITH DEVELOPMENT**

---

## 6.01 PEDESTRIANS AND BICYCLES

The proposed redevelopment plan would maintain and upgrade pedestrian accommodations surrounding the site. Additionally, the parking area layout would prioritize pedestrian movements.

The surrounding bicycle network would be maintained. Archipelago Village would include a substantial amount of new bicycle parking to address code requirements. Additionally, Archipelago Village will investigate the possibility of hosting a B-Cycle rental bike station. Planned uses for the site, such as the specialty hotel, could benefit from convenient and available bicycle transportation.

## 6.02 TRANSIT

Because the site is adjacent to East Washington Avenue, it would maintain relatively high transit service levels with development.

The development will create higher densities for both households and employment. This in turn could provide more potential for ridership. It may also help provide the higher density/trip making potential that would support BRT implementation.

## 6.03 MOTOR VEHICLES

### A. Site Access Configuration

Figure 6.03-1 illustrates the proposed access configuration of the site. By having access points on all streets bordering the site, development traffic is distributed more evenly to the adjacent road network. The proposed site provides four new access points; North Access on East Washington Avenue (right-in/right out), East Access on Bearly Street, South Access on Main Street, and West Access on Paterson Street. The East, West, and South Access points provide full access at their respective locations. They are stop-controlled on the exiting approaches with a single shared left/right exiting lane.

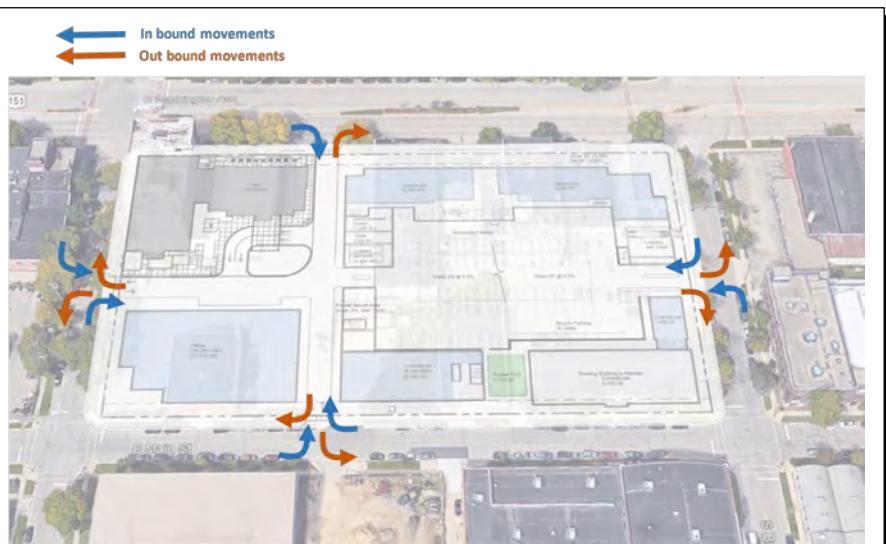

Figure 6.03-1 Proposed Archipelago Access Configuration

On-street parking would need to be restricted for 100 feet or so adjacent to the driveways to provide adequate sight distance for entering and exiting vehicles.

## B. Traffic Volumes

As mentioned in Section 2 of this report, the development volumes were generated using the *ITE Trip Generation Manual*, 10th Edition and a 30 percent reduction. Figure 6.03-2 shows the 2037 Existing Geometry With Development volumes.

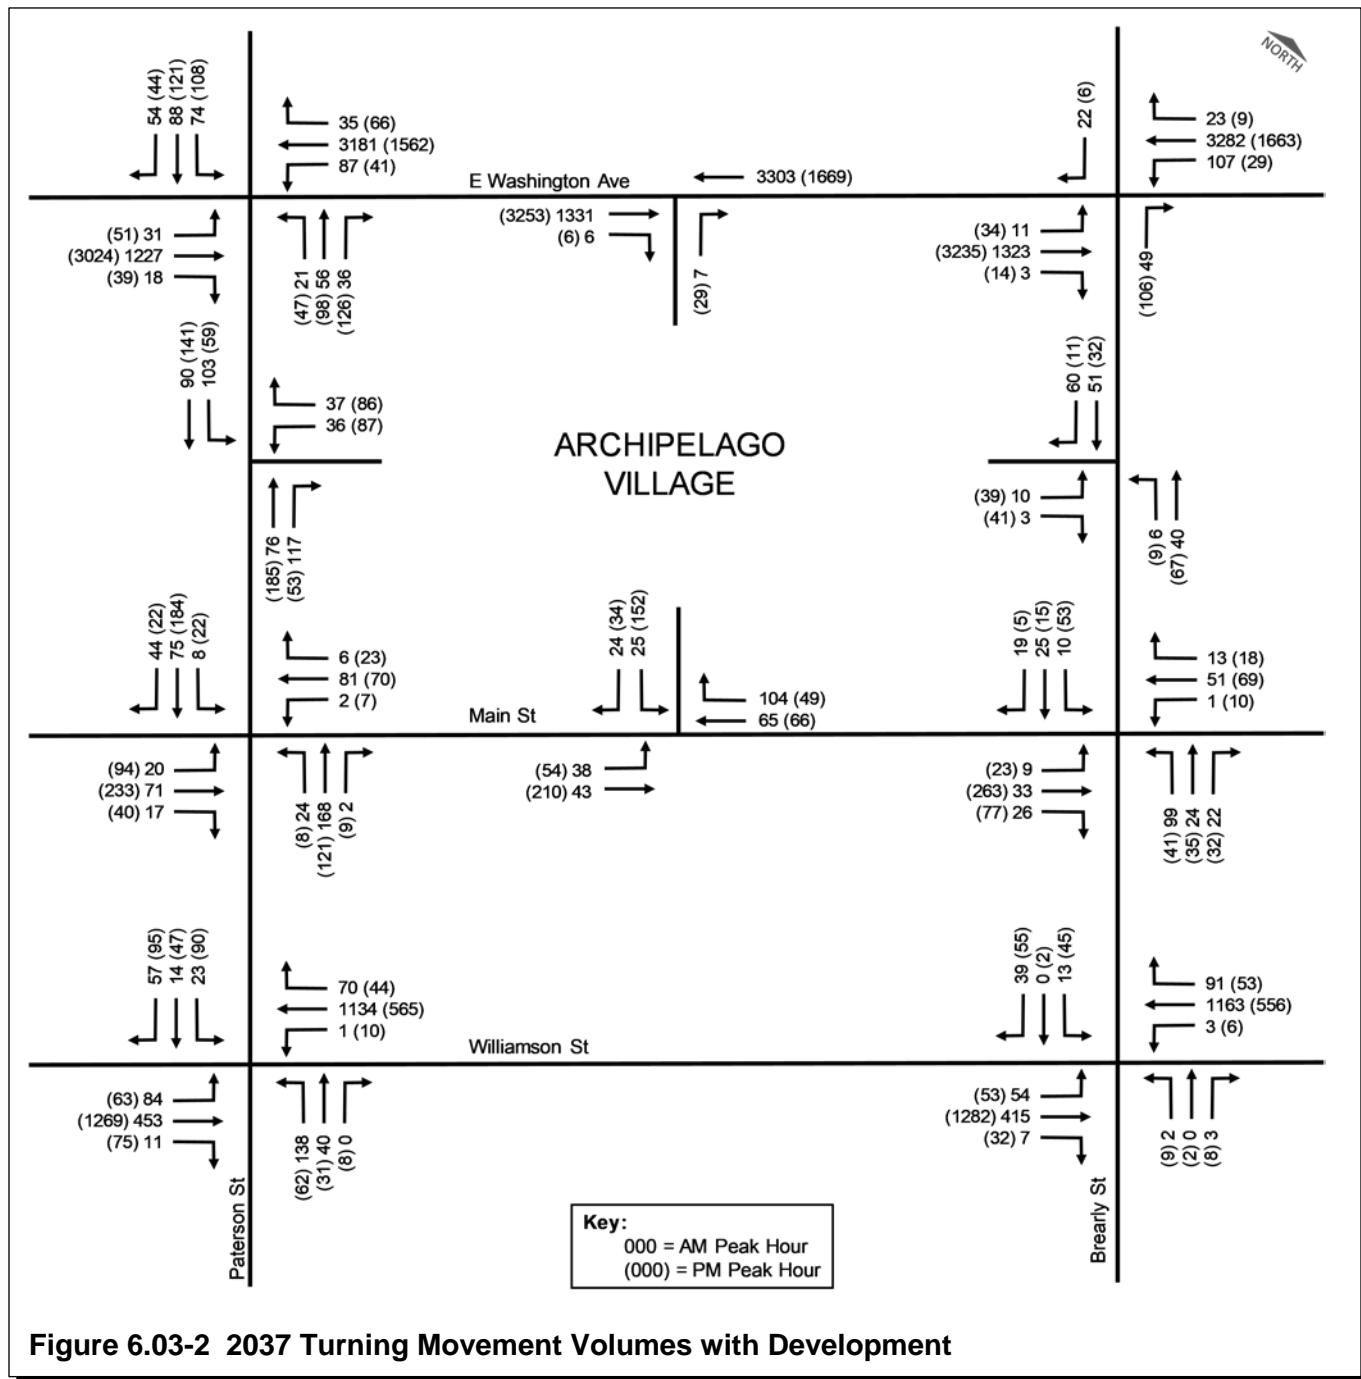

Figure 6.03-2 2037 Turning Movement Volumes with Development

C. Traffic Operations–2037 Existing Geometry With Development

Tables 6.03-1 and 6.03-2 summarize and compare the intersection operations with existing geometry without development, and with existing geometry with development. The modeling reports are provided in Appendix G. Summary tables of all the modeling scenarios are included in Appendix I.

Table 6.03-2 2037 PM Peak Hour Operations, With and Without Development

1. 2037 AM Peak Hour Operations—With Development

a. East Washington Avenue and Paterson Street.

The signalized East Washington Avenue and Paterson Street intersection would operate at LOS B with a maximum V/C ratio of 0.90. The westbound through movements operate at LOS B with 95th and 50th percentile queues of approximately 535 feet and 380 feet, respectively. The 95th percentile queues represent the length expected to be exceeded during 5 percent of the weekday peak hours. The 50th percentile queues represent average peak-hour conditions, so queues will sometimes be shorter and sometimes be longer. The 95th percentile westbound queues may extend into the Bearly Street intersection, which is located about 540 feet east of the East Washington Avenue and Paterson Street intersection. SimTraffic microsimulation model observations indicate that this queueing would clear during each signal cycle.

The eastbound left-turn movement would operate at LOS E with 95th percentile queues of approximately 50 feet. The northbound movements would operate at LOS D with 95th and 50th percentile queues of approximately 130 feet and 70 feet, respectively. The West Access intersection is located about 150 feet south of the East Washington Avenue and Paterson Street intersection, so the longest northbound queues may reach the West Access intersection leading to internal exiting queues.

SimTraffic microsimulation model observations indicate that the eastbound left-turn queueing would be stored within the existing 115 feet storage bay. The observations also indicate the northbound queuing would generally clear during each signal cycle.

b. East Washington Avenue and Bearly Street

The side-street stop-controlled East Washington Avenue and Bearly Street intersection would operate at LOS F with a maximum V/C ratio of 0.75. The eastbound left-turn movement operates at LOS F with 95th percentile queues of approximately 50 feet. The southbound right-turn movement operates at LOS F with 95th percentile queues of approximately 40 feet. SimTraffic microsimulation model observations indicate the queuing from these two LOS F movements would be stored within the existing turn bays/lanes.

c. East Washington Avenue and Ingersoll Street

The signalized East Washington Avenue and Ingersoll Street intersection would operate at LOS B with a maximum V/C ratio of 0.93. The westbound through movement would operate at LOS B with 95th and 50th percentile queues of approximately 590 feet and 425 feet, respectively. The Few Street intersection is located about 575 feet east of the East Washington Avenue and Ingersoll Street intersection, so the westbound longest through queue may extend into the Few Street intersection. SimTraffic microsimulation model observations indicate that this queuing would generally clear during each signal cycle.

d. Main Street and Paterson Street

The all-way stop-controlled Main Street and Paterson Street intersection would operate at LOS A with a maximum V/C ratio of 0.29. All the movements have 95th percentile queues of 30 feet or less.

e. Main Street and Bearly Street

The all-way stop-controlled Main Street and Bearly Street intersection would operate at LOS A with a maximum V/C ratio 0.24. All the movements have 95th percentile queues of 25 feet or less.

f. Williamson Street and Paterson Street

The signalized Williamson Street and Paterson Street intersection would operate at LOS B with a maximum V/C ratio of 0.77. The westbound movements have 95th percentile queues of approximately 220 feet.

The eastbound movements would operate at LOS B with 95th and 50th percentile queues of approximately 365 feet and 180 feet, respectively. The Livingston Street intersection is located about 580 feet west of the Williamson Street and Paterson

Street intersection. SimTraffic microsimulation model observations indicate that the eastbound queues may block the Livingston Street intersection because of the single eastbound-shared lane available during the AM peak hours. It is worth noting that under field conditions the eastbound through traffic will be able to bypass one or two left-turning vehicles; therefore, the SimTraffic microsimulation model may be overstating the queue lengths.

g. Williamson Street and Bearly Street

The side-street stop-controlled Williamson Street and Bearly Street intersection operates at LOS F with a maximum V/C ratio of 0.54. The southbound movements operate at LOS F with 95th percentile queues of approximately 65 feet. SimTraffic microsimulation model observations indicate that the southbound queues are six vehicles or less.

h. Archipelago Village North Access

The North Access intersection is unsignalized, and operates at LOS C with a maximum V/C ratio of 0.02. All the movements have 95th percentile queues of less than 25 feet.

i. Archipelago Village East Access

The East Access intersection is unsignalized, and operates at LOS A with a maximum V/C ratio of 0.02. All the movements have 95th percentile queues of less than 25 feet.

j. Archipelago Village South Access

The South Access intersection is unsignalized, and operates at LOS B with a maximum V/C ratio of 0.07. All the movements have 95th percentile queues of less than 25 feet.

k. Archipelago Village West Access

The West Access intersection is unsignalized, and operates at LOS B with a maximum V/C ratio of 0.12. All the movements have 95th percentile queues of less than 25 feet.

2. 2037 PM Peak-Hour Operations–With Development

a. East Washington Avenue and Paterson Street.

The signalized East Washington Avenue and Paterson Street intersection would operate at LOS B with a maximum V/C ratio of 0.90. The eastbound through movements would operate at LOS B with 95th and 50th percentile queues of approximately 535 feet and 420 feet, respectively. The 95th percentile queues may extend into the Livingston Street intersection. SimTraffic microsimulation model

observations indicate that this queueing would generally clear during each signal cycle.

The westbound left-turn movement operates at LOS D with 95th percentile queues of approximately 55 feet. The northbound movements operate at LOS D with 95th and 50th percentile queues of approximately 270 feet and 165 feet, respectively. The West Access intersection is located approximately 150 feet south of the East Washington Avenue and Paterson Street intersection, so the northbound average and longest queues may block the West Access intersection leading to internal exiting queues. SimTraffic microsimulation model observations indicate that the westbound left-turn queueing would be stored within the existing 150-foot storage bay, and the northbound queueing may block the West Access intersection.

b. East Washington Avenue and Bearly Street

The side-street stop controlled East Washington Avenue and Bearly Street intersection would operate at LOS F with a maximum V/C ratio of 1.48. The northbound right-turn movement would operate at LOS F with 95th percentile queues of approximately 225 feet. The East Access intersection is located approximately 150 feet south of the East Washington Avenue and Bearly Street intersection, so the northbound queueing may block the East Access intersection, which could lead to internal exiting queues. The westbound left-turn movement operates at LOS F with 95th percentile queues of approximately 90 feet. The existing westbound left-turn storage bay is approximately 75 feet, so the 95th percentile queues may extend beyond the turn bay. SimTraffic microsimulation model observations indicate the northbound queue may block the East Access, and the westbound left-turn queue would be stored within the existing turn bay.

c. East Washington Avenue and Ingersoll Street

The signalized East Washington Avenue and Ingersoll Street intersection would operate at LOS B with a maximum V/C ratio of 0.99. The eastbound through movement would operate at LOS B with 95th and 50th percentile queues of approximately 200 feet and 110 feet, respectively. The northbound right turn operates at LOS D with 95th and 50th percentile queues of approximately 70 feet and 35 feet, respectively. SimTraffic microsimulation model observations indicate that the eastbound queueing would generally clear during each signal cycle.

d. Main Street and Paterson Street

The Main Street and Paterson Street intersection operates at LOS B with a maximum V/C ratio of 0.57. All the movements operate at LOS B or better with 95th percentile queues of less than 100 feet.

e. Main Street and Bearly Street

The Main Street and Bearly Street intersection operates at LOS B with a maximum V/C ratio 0.55. All the movements operate at LOS B or better with 95th percentile queues of less than 100 feet.

f. Williamson Street and Paterson Street

The signalized Williamson Street and Paterson Street intersection would operate at LOS B with a maximum V/C ratio of 0.78. The westbound movements would operate at LOS A with 95th percentile queues of 225 feet. SimTraffic microsimulation model observations indicate that the westbound left-turn movement causes some queues because of the restricted single shared lane available during the PM peak hours, but this queueing would not reach the Bearly Street intersection. It is worth noting that under field conditions, the westbound through traffic will be able to bypass one or two left-turning vehicles, therefore the SimTraffic microsimulation model may be overstating the queue lengths.

g. Williamson Street and Bearly Street

The side-street stop controlled Williamson Street and Bearly Street intersection would operate at LOS F with a maximum V/C ratio of 0.79. The northbound movements would operate at LOS F with 95th percentile queues of approximately 45 feet. The southbound movements would operate at LOS F with 95th percentile queues of approximately 120 feet. Observation of the SimTraffic microsimulation model indicates the northbound and southbound queues are six vehicles or less.

h. Archipelago Village North Access

The North Access intersection would operate at LOS F with a maximum V/C ratio of 0.45. The northbound right-turn movement would operate at LOS F with 95th percentile queues of 45 feet or less. SimTraffic microsimulation model observations indicate this internal queueing could be two vehicles or less.

i. Archipelago Village East Access

The East Access intersection would operate at LOS A with a maximum V/C ratio of 0.09. All of the movements have 95th percentile queues of less than 25 feet. SimTraffic microsimulation model observations indicate this internal queueing could be four vehicles or less.

j. Archipelago Village South Access

The South Access intersection would operate at LOS B with a maximum V/C ratio of 0.33. All the movements have 95th percentile queues of less than 35 feet. SimTraffic

microsimulation model observations indicate this internal queueing could be four vehicles or less.

k. Archipelago Village West Access

The West Access intersection would operate at LOS B with a maximum V/C ratio of 0.29. All the movements have 95th percentile queues of less than 30 feet. SimTraffic microsimulation model observations indicate that the northbound through movement and exiting westbound movements may experience delays/queues because of the northbound queuing at the East Washington Avenue and Paterson Street intersection.

---

**SECTION 7**  
**RECOMMENDATIONS**

## 7.01 PEDESTRIAN AND BICYCLE IMPROVEMENTS

If or when the proposed signalization of the East Washington Avenue and Bearly Street occurs the Study Team recommends pedestrian signal heads and push buttons at this intersection. No additional alternatives are proposed external to the site.

Based on the City's requirements for off-street parking, Table 7.01-1 shows the bicycle parking spaces for this development site assuming shared use. Archipelago Village LLC is working with the City to determine the appropriate number of bicycle parking spaces. As of February 18, 2019, the proposed bicycle parking at build-out is 200 spaces.

Specified Land Use	Off-Street Parking Requirements	Shared Parking Calc	
		Daytime Use	Evening Use
High-Turnover (Sit-Down) Restaurant	5% of capacity of persons	8	9
Quality Restaurant	5% of capacity of persons	20	25
General Retail	1 per 2,000 sf	34	34
Hospital/Clinic	1 per 5 employees	2	2
General Office Building	1 per 2,000 sf	136	
Hotel	1 per 10 bedrooms	13	25
Apartment	1/unit up to 2 bedrooms; 1 guest space per 10 units	59	235
Totals		271	330
Mixed use/local trip rates reduction (-30%)		-81	-99
Adjusted Totals		190	231

Off-Street Parking Requirements from the City of Madison.

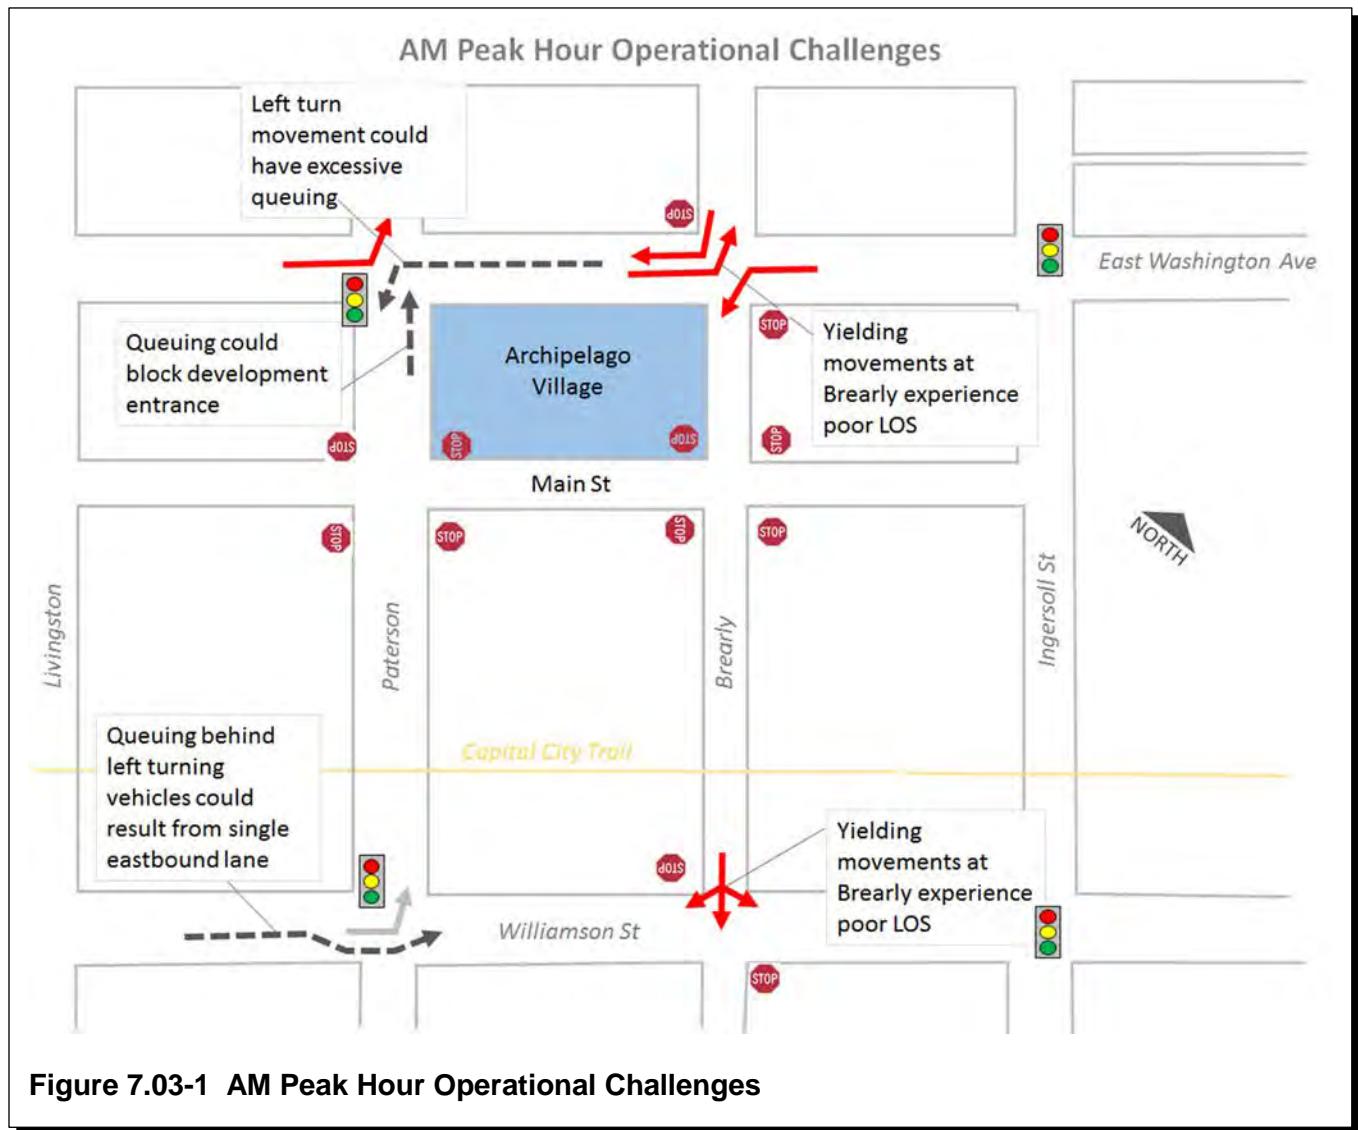

**Table 7.01-1 Archipelago Village Bicycle Parking**

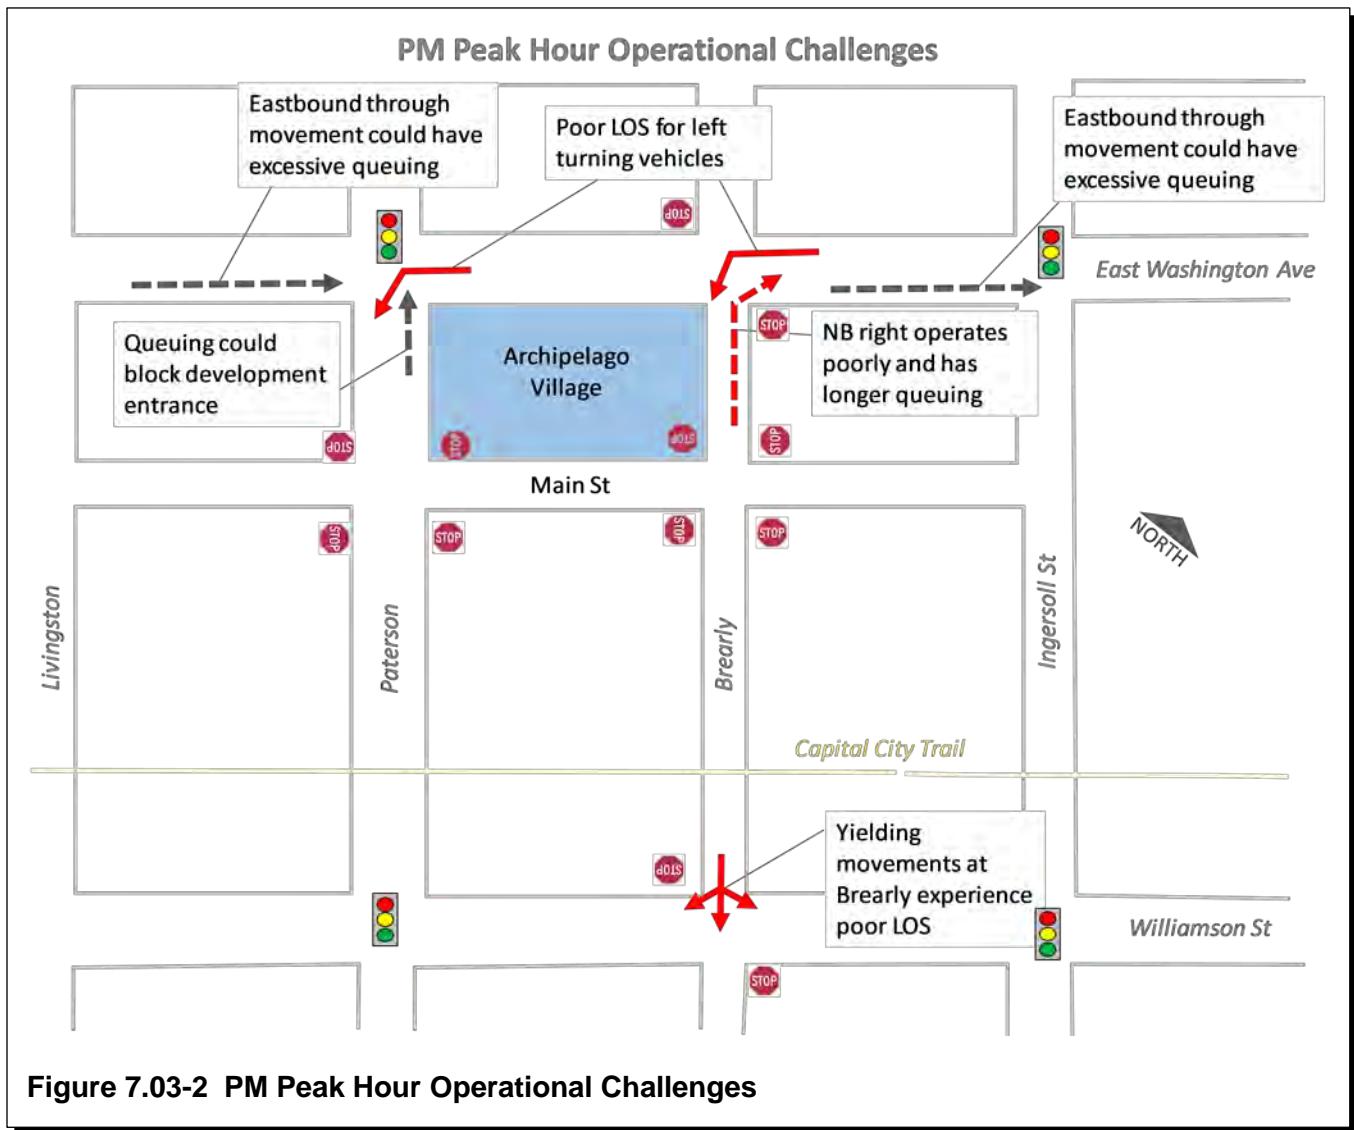

## 7.02 TRANSIT

The site has high levels of transit service, which will grow higher if BRT is implemented. Archipelago Village will work with the City to determine the appropriate transit accommodations for the site.

## 7.03 MOTOR VEHICLES

Figures 7.03-1 and 7.03-2 graphically illustrate the operational challenges associated in the roadway network surrounding Archipelago Village. Many of these challenges currently exist, or would exist even without the Archipelago Village development as a result of background traffic growth alone. Appendix H includes the recommendations modeling reports and Appendix I includes the summary tables for all scenarios.

**Figure 7.03-2 PM Peak Hour Operational Challenges**

### 1. East Washington Avenue and Paterson Street

The traffic modeling indicates that sometime between 2017 and 2037 queueing will become more substantial for a few movements with or without the proposed development site. As noted previously, some movements in the AM and PM may approach or reach upstream intersections, or exceed the existing storage length.

The Study Team recommends adding a northbound left-turn bay at the intersection of East Washington Avenue and Paterson Street. This left turn bay could be accomplished by restricting parking on the northern 200 feet of Paterson Street. With this treatment, all movements operate at LOS D or better during the AM and PM peak hours. Table 7.03-1 shows the AM and PM traffic modeling results of this alternative.

**Table 7.03-1 2037 East Washington Avenue and Paterson Street Traffic Modeling Results, with Recommended Improvements**

2. East Washington Avenue and Bearly Street

The traffic modeling of existing conditions indicates that some yielding movements at the stop-controlled intersection operate at LOS F during the AM and PM peak hours today. The eastbound left-turn and southbound right-turn movements operate at LOS F during the AM peak hour, and

the northbound right-turn and westbound left-turn movements operate at LOS F during the PM peak hour. Operations deteriorate with or without the proposed traffic from Archipelago Village.

The Study Team recommends a partial signal similar to the one at Livingston Street that would provide signal control for the eastbound and westbound left turns at this intersection. Signalizing these left turns would also allow a northbound and southbound right-turn overlap, addressing the queuing concerns. Because this intersection prohibits north and southbound through movements, the signal could be coordinated with adjacent signals and minimize the impact of the time taken away from the East Washington Avenue coordinated through movements.

Adding a signal improves operations to LOS A during the AM and PM peak hours. All individual movements operate at LOS D or better during the AM and PM peak hours. Table 7.03-2 shows the traffic modeling results of this alternative including the 50th and 95th percentile queues.

**Table 7.03-2 2037 East Washington Avenue and Bearly Street Traffic Modeling Results, with Recommended Improvement**

3. East Washington Avenue and Ingersoll Street

Traffic modeling indicates that sometime between 2017 and 2037 queueing will become more substantial for a few movements with or without traffic from Archipelago Village. The westbound and eastbound queueing may reach the upstream intersections during the AM and PM peak

hours, respectively. Despite the LOS E movement during the PM peak hour, overall LOS remains acceptable with the development traffic. Because the overall intersection operation is acceptable, the Study Team recommends no additional improvements to the intersection of East Washington Avenue and Ingersoll Street. Table 7.03-3 shows the traffic modeling results of this alternative including the 50th and 95th percentile queues.

<u><b>AM PEAK</b></u>							
Control	Signal Control						
Approach	Movement	Volume	Delay (s)	LOS	V/C	95th Queue (ft)	Intersection Delay (s)

**Table 7.03-3 2037 East Washington Avenue and Ingersoll Street Traffic Modeling Results, with Recommended Improvements**

4. Main Street and Paterson Street

The Main Street and Paterson Street intersection will operate acceptably as an all-way stop-controlled intersection. No further improvements are recommended.

5. Main Street and Bearly Street

The Main Street and Bearly Street intersection will operate acceptably as an all-way stop-controlled intersection. No further improvements are recommended.

6. Williamson Street and Paterson Street

The traffic modeling indicates that sometime between 2017 and 2037 queueing will become more substantial for the eastbound movements during the AM peak hour. These queues may reach the Livingston Street intersection upstream. As noted previously, the eastbound through traffic will be able to bypass one or two left-turning vehicles under field conditions. Despite the queueing, overall LOS remain acceptable with the development traffic.

The Study Team recommends extending the eastbound no parking restriction on the corner of Williamson Street to the west/upstream, which would help eastbound through vehicles bypass left-turning traffic during the AM peak hour. The Study Team coded a 50-foot turn bay to resemble the no parking restriction in the operations model, and this modification reduced the eastbound queues by about 50 percent during the AM peak hour.

**Table 7.03-4 Williamson Street and Paterson Street 2037 Traffic Modeling Results, with Recommended Improvements**

### 7. Williamson Street and Bearly Street

The existing conditions traffic modeling indicates that some yielding movements at the stop-controlled intersection operate at LOS F during the AM and PM peak hour. In 2037, all southbound movements operate at LOS F during the AM and PM peak hours, and all the

northbound movements operate at LOS F during the PM peak hour. Because of the close spacing of signals on Williamson Street, the Study Team does not recommend signalizing the Williamson Street and Bearly Street intersection. Delays associated with this intersection may cause some travelers to use alternate intersections, such as Ingersoll Street, to access Williamson Street. Table 7.03-5 shows the traffic modeling results of this alternative.

**Table 7.03-5 Williamson Street and Bearly Street 2037 Traffic Modeling Results, with Recommended Improvements**

8. North Access and East Washington Avenue

The Study Team recommends an eastbound parking restriction on East Washington Avenue for about 150 feet to provide adequate sight distance for exiting vehicles.

9. East Access and Bearly Street

The Study Team recommends restricting parking on the west side of the street and shifting the centerline marking four feet to the west. This would allow through vehicles and cyclists the opportunity to travel around northbound vehicles making a left into the Archipelago Village parking lot.

10. South Access and Main Street.

The Study Team recommends restricting parking on the north side of the street and shifting the centerline marking four feet to the north. This would allow through vehicles and cyclists the opportunity to travel around eastbound vehicles making a left into the Archipelago Village parking lot.

11. West Access and Paterson Street.

The study team recommends restricting parking on both sides of the street to allow for a northbound left-turn lane at the East Washington Avenue intersection, and to provide a southbound left-turn refuge for vehicles turning into the Archipelago Village parking lot. This likely will require a 50-foot northbound left-turn storage bay at East Washington, a 75-foot taper, and a 25-foot left-turn bay for the Archipelago Village parking lot.
